UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

REGION 4
ATLANTA FEDERAL CENTER
61 FORSYTH STREET
ATLANTA, GEORGIA 30303-8960

August 19, 2008

The Honorable Phil Bredesen
Governor of Tennessee
State Capitol, First Floor
Nashville, Tennessee 37243

Dear Governor Bredesen:

As you are aware, reducing fine particle pollution (PM_{2.5}) represents one of the most significant challenges to improving air quality in our nation today. Health studies link these tiny particles – about 1/30th the diameter of a human hair – to serious human health problems, including aggravated asthma, increased respiratory symptoms like coughing and difficult or painful breathing, chronic bronchitis, decreased lung function, and even premature death in people with heart and lung disease. Fine particle pollution can remain suspended in the air for long periods of time and create public health problems far away from emission sources. Reducing levels of PM_{2.5} is an important part of our nation's commitment to clean, healthy air.

We have reviewed the December 13, 2007, letter from James H. Fyke, Commissioner of the Tennessee Department of Environment and Conservation (TDEC), and the June 10, 2008, letter from Barry R. Stephens, P.E., Director of TDEC's Division of Air Pollution Control, submitting Tennessee's recommendations on air quality designations for the 2006 24-Hour PM_{2.5} standards. We have also reviewed the technical information submitted to support Tennessee's recommendations. In accordance with the Clean Air Act, I write to inform you that the U.S. Environmental Protection Agency (EPA) intends to modify Tennessee's recommended designations and boundaries. Enclosed please find a detailed description of areas where EPA intends to modify TDEC's recommendations, and the basis for such modification. In addition, we are enclosing the results of our review of Tennessee's requests for consideration of data under the Exceptional Events rule for the Chattanooga and Clarksville areas. We understand that TDEC has concerns about the monitoring data in the Clarksville area, and that TDEC has installed an additional monitoring site in the area and intends to submit information from the new study to EPA as it becomes available. Additionally, we understand that TDEC made recommendations based on the 2004 – 2006 period, and because the data were not yet quality assured as of its June 10, 2008, submission, TDEC did not include data from any monitor in the Knoxville area which were above the standard for 2005 – 2007. If you have additional information that should be considered by EPA in this process, please provide it to us by October 20, 2008. In the near future, EPA will publish a notice in the Federal Register to solicit public comments on our intended designation decisions. We intend to make final designation decisions for the 2006 24-Hour PM_{2.5} standards by December 18, 2008.

EPA has taken steps to reduce fine particle pollution across the country, such as implementing the Clean Diesel Program to dramatically reduce emissions from highway, nonroad and stationary diesel engines. In addition to on-going initiatives, state programs to attain the 1997 PM_{2.5} standards will also help to reduce unhealthy levels of fine particle pollution.

I appreciate the leadership and attention provided by you and the management and staff of TDEC in protecting air quality. If you have any questions, please do not hesitate to contact me at (404) 562-8357. We look forward to continuing to work with you and TDEC officials in implementing the PM_{2.5} standards.

Sincerely,

A handwritten signature in black ink, appearing to read "J. I. Palmer, Jr.", with a stylized flourish at the end.

J. I. Palmer, Jr.
Regional Administrator

Enclosures

**PM_{2.5} Exceptional Events
Technical Support Document**

**U.S. Environmental Protection Agency
Region 4**

State of Tennessee

2007

2008 Technical Support Document for the State of Tennessee Fine Particulate Matter Exceptional Event Demonstration

I. Introduction

A technical support document (TSD) has been prepared to discuss the rationale for concurrence or non-concurrence with requests to apply data flags on fine particulate matter (PM_{2.5}) concentrations that may have been impacted by exceptional events and that may have exceeded the National Ambient Air Quality Standards (NAAQS). The State of Tennessee (Tennessee) has identified several PM_{2.5} concentrations that may have been impacted by wildfires that originated in southern Georgia and northern Florida during the 2007 monitoring cycle. Tennessee has prepared and submitted documentation to support requests for concurrence with exceptional event data flags in accordance with current federal regulations regarding exceptional events. Key excerpts from *Part 50 National Primary and Secondary Ambient Air Quality Standards* are provided in Section II. Any exceptional event flags that EPA Region 4 concurs with will be excluded from use in determinations of exceedances and National Ambient Air Quality Standards (NAAQS) violations.

II. Excerpts from Exceptional Event Regulations

A. Definition of an Exception Event: According to §50.1(j): “Exceptional event means an event that affects air quality, is not reasonably controllable or preventable, is an event caused by human activity that is unlikely to recur at a particular location or a natural event, and is determined by the Administrator in accordance with 40 CFR 50.14 to be an exceptional event. It does not include stagnation of air masses or meteorological inversions, a meteorological event involving high temperatures or lack of precipitation, or air pollution relating to source noncompliance.”

B. Definition of an Exceedance: Exceedance with respect to a national ambient air quality standard means one occurrence of a measured or modeled concentration that exceeds the specified concentration level of such standard for the averaging period specified by the standard.

C. Exclusion of Data: EPA shall exclude data from use in determinations of exceedances and NAAQS violations where a State demonstrates to EPA's satisfaction that emissions from fireworks displays caused a specific air pollution concentration in excess of one or more national ambient air quality standards at a particular air quality monitoring location and otherwise satisfies the requirements of this section. Such data will be treated in the same manner as exceptional events under this rule, provided a State demonstrates that such use of fireworks is significantly integral to traditional national, ethnic, or other cultural events including, but not limited to July Fourth celebrations which satisfy the requirements of this section.”

D. Criteria for Exclusion: The demonstration to justify data exclusion shall provide evidence that

- (1) The event satisfies the criteria set forth in 40 CFR 50.1(j);
- (2) There is a clear causal relationship between the measurement under consideration and the event that is claimed to have affected the air quality in the area;
- (3) The event is associated with a measured concentration in excess of normal historical fluctuations, including background; and
- (4) There would have been no exceedance or violation but for the event.

III. Evaluation of PM_{2.5} Concentrations and Supporting Documentation

In order to meet criteria 1 and 2 listed in Section II of this document, Tennessee provided supporting documentation which included PM_{2.5} speciation data, wind trajectories, meteorological data (including graphs, charts, and various satellite images), and statistical data. Each PM_{2.5} 24-hr average concentration requested for exclusion was first evaluated against these criteria using a two-step analysis. This analysis was designed to compare the requested value to historical values observed at the site and determine whether the concentration was an exceedance of the 24-hr PM_{2.5} NAAQS and whether any exceedances could have been caused by the flagged event.

Step 1: Monthly Average Comparison

Using 24-hr PM_{2.5} data from AQS for 2004-2007, a comparison three-year monthly average was calculated. The three-year monthly average concentration was calculated excluding data from the year in which the data in question was collected. For example, a requested value in May 2006 was compared to the average of all the samples collected at the site during May 2004, May 2005, and May 2007. If the three-year average was greater than the annual PM_{2.5} NAAQS (15.0 µg/m³) and the requested value was less than the 24-hr PM_{2.5} NAAQS (35 µg/m³), then EPA concurrence was not given to the requested value. This is because in EPA's judgment there is insufficient evidence that "there would have been no exceedance or violation but for the event" as required by §50.14(c)(3)(iii)(D) because the normally expected concentration at the site (the three-year monthly mean concentration) is in excess of the NAAQS.

Step 2: Monthly 84th Percentile Comparison

Using 24-hr PM_{2.5} data from AQS for 2004-2007, a comparison three-year upper 84th percentile was calculated for the month in which the requested value was collected. The three-year monthly 84th percentile was calculated excluding data from the year in which the data in question was collected. For example, a requested value in May 2006 was compared to the upper 84th percentile calculated from all the samples collected at the site during May 2004, May 2005, and May 2007. The calculated three-year monthly upper 84th percentile was considered to represent the range of normally expected high values at that site due to normal local and background sources. If the requested value was below the calculated three-year monthly upper 84th percentile, EPA concurrence was not given to the requested value. This is because in EPA's judgment that there is insufficient evidence to demonstrate that the NAAQS exceedance was caused by the suspected event as required by §50.14(c)(3)(iii)(D) and not by normal local and background sources at the site.

If a requested value did not meet the requirements described in one or more of the above steps and Tennessee did not submit compelling evidence to demonstrate that the event satisfied the exceptional event criteria, then EPA concurrence was not given to the exceptional event flag on the requested value. The values that did meet all of the conditions described above were then evaluated against the requirements of §50.14(c)(3)(iii).

Summary of maps and graphs used

Additional maps and graphs were generated by EPA to provide assistance in completing the review of the Tennessee submittal. The graphics provided in this document were not included in Tennessee's submittal. The additional maps and graphs have been included in this TSD as appropriate. Unless otherwise noted, these products were obtained from the DATAFED Data Views Catalog, which can be accessed at

http://datafedwiki.wustl.edu/index.php/Data_Views_Catalog. This may include maps using data from AQS, the National Aeronautics and Space Administration (NASA), and the Navy Aerosol Analysis and Prediction System (NAAPS). Also, unless otherwise noted, all ambient air monitoring data used in this analysis was obtained from the EPA AQS database.

IV. Data Evaluation

The State of Tennessee identified forty-eight concentrations that were potentially impacted by wildfire smoke. In Tables 1 and 2, the observed concentrations, monthly averages, 84th and 95th percentiles, and results of the two-step analysis are provided, along with EPA's preliminary response to the submittal. Documentation submitted by Tennessee claims that smoke from wildfires in South Georgia and North Florida caused NAAQS exceedances at the sites listed in the tables.

Table 1 lists the concentrations that passed both steps of the initial analysis. Further analysis of available data and documentation was determined necessary for completing the review. The discussions that follow will demonstrate that the 24-hr average PM_{2.5} concentrations listed in Table 1 meet or fail to meet the criteria described in the Exceptional Events Rule, §50.14.

Table 2, which is located in the Appendix, lists values that failed to pass both steps of the initial analysis. Also, the documentation submitted by Tennessee did not demonstrate a clear causal relationship between the measured concentration and the event, and did not demonstrate that there would have been no exceedance or violation but for the event. Due to these reasons, no further analysis of the data in Table 2 was deemed necessary. EPA concurrence was not given to these exceptional event flags.

Table 1. Concentrations that passed Steps 1 and 2.

Date	AQS ID	County	MSA	Observed Conc.	Monthly Average	84th Percentile	95 th Percentile	Step 1	Step 2	EPA Concur

V. Discussion of Evidence

A. Event Description: Southern Georgia and North Florida Wildfires

The Bugaboo Scrub Fire (Figure 1a) was a wildfire that raged from April to June in 2007 and ultimately became the largest fire in the history of both Georgia and Florida. The Bugaboo Scrub Fire, which was not actually named until it had blazed for nearly a month, started in the Okefenokee Swamp, most of which is located in Georgia. It was previously known as the Sweat Farm Road Fire, which merged with the Big Turnaround Complex Fire shown in Figure 1b. Due to the amount of acreage consumed by these wildfires, large amounts of smoke persisted in the air from May through the first week of June. Wind transported much of this smoke throughout the southeastern region. The presence of particulate matter, a large constituent of smoke, was observed at many monitoring sites and in many cases caused very large increases in the measured 24-hour $PM_{2.5}$ mass concentrations.

Figure 1a. Bugaboo Scrub Fire, April 29, 2007.

Figure 1b. Sweat Farm Road Fire, April 28, 2007.

B. Causal Relationship between the Event and Air Quality

To evaluate the possible causal relationship of the wildfires on air quality in Montgomery (Clarksville) and Lawrence Counties, maps and wind trajectories were analyzed to assess the probability of smoke transport from the wildfires. Figure 3 illustrates spatially averaged $PM_{2.5}$ concentrations that were used to assess the possible impacts of smoke on air quality. Figure 4 illustrates backwards wind trajectories that passed through the suspected source region on each of the days under consideration. These trajectories support the possible transport of smoke through Lawrence County and Clarksville on some of these days. Figure 5 depicts the NASA OMI aerosol index observed on each of the days in question that exceeded the NAAQS 24 hr standard ($35 \mu g/m^3$).

Speciation data was collected at the Clarksville site (AQS ID 47-125-1009) on a 1 in 6 day sampling schedule. Because of this schedule, speciation data was limited and only available for May 30 and August 4. Federal reference method (FRM) mass, organic carbon, and sulfate mass are shown in the graph in Figure 10.

C. Comparison to Historical Levels

In order to further assess the impacts of the Georgia and Florida fires, the data in question was compared to historical levels observed at each site. Table 1 shows that all of the values that passed both steps of the initial analysis vary in terms of the levels above the 95th percentile calculated from data collected during the respective months for 2004-2006. May 19 and August 4 are considerably higher than the 95th percentiles, which strongly suggest that the data were influenced by an exceptional event. Figure 3 shows the spatially averaged 24-hr average PM_{2.5} concentrations observed on each of the days in question. Figures 1 and 2 show the excess PM_{2.5} concentrations observed above the 84th and 95th percentiles, respectively, on each of the days. These maps show 24-hr average PM_{2.5} concentrations above the normal range of values observed in the Clarksville area historically during the respective months.

D. Demonstration of No Exceedance “But For” the Event

The values reported for May 22, 25, 26, 27, 29, and June 17 passed the initial screening tests, however, they do not exceed the 24-hour standard (35 ug/m³). Further, Table 1 shows that several values do not exceed the 95th percentiles. Without PM_{2.5} speciation data available for any of these values, it is EPA’s judgment that there is insufficient evidence to determine that “there would have been no exceedance or violation but for the event.” Further, the information provided in Tennessee’s submittal was inconclusive in demonstrating a causal relationship. EPA concurrence was not given for any of these days.

The values reported for May 19, 28, July 31, August 1, and August 3 exceed the 24-hour standard (35 ug/m³); however, PM_{2.5} speciation data was not available for these specific days. Without these data, determining an organic mass apportionment was not possible. A significantly high PM value was observed in Clarksville on May 19 of 56.2 ug/m³. Although the value is significantly higher than the 95th percentile value (21.1 ug/m³), an evaluation of the maps in Figures 3 and 4 suggests that the high value was not due to air mass movement from the wildfires but from a localized event or source. The lack of wind trajectories approaching and leaving the Clarksville area from the southern Georgia and north Florida areas on this day suggests possible stagnation of air in the area. For the other days, figures 3 and 4 also indicate high PM concentrations in the Clarksville area, although figure 5 indicates low aerosol levels in both source and impact areas. As with May 19, the lack of wind trajectories suggest localized sources. Without PM_{2.5} speciation data, there is insufficient evidence to determine that “there would have been no exceedance or violation but for the event.” EPA concurrence was not given for any of these days.

May 30 and August 4 both reported concentrations that were exceedances of the 24-hr PM_{2.5} standard (35ug/m³). The values for May 30 and August 4 were, respectively, in excess of the historical 95th percentile by 14.6 ug/m³ and 7.6ug/m³ for the Clarksville site in the months of May and August. This is an indication that these monitors may have been impacted by an exceptional event. PM_{2.5} speciation data was available for both days which allowed for a more critical analysis of the components of the PM mass. Figures 6a through 9b show varying images of the national levels of organic carbon and sulfates measured on May 30 and August 4. While these images are helpful in providing an overall view, they are somewhat inconclusive for assessing specific areas.

Figure 10 shows the levels of PM_{2.5} organic carbon and sulfate compounds compared to the total PM mass. For May 30, the graph shows that the organic carbon level is higher than sulfate, and may represent a greater portion of the PM mass. Figure 11 shows the adjusted PM_{2.5} mass in relation to the NAAQS standards. Typically, these estimations would be made based on several years of historical data. Clarksville's calculations are based on one year of available speciation data from 2007. The data shows the impact that would be made on the PM mass if organic carbon and sulfates were removed from the mass. For May 30, the graph suggests that the removal of the organic carbon would reduce the PM mass significantly and well below the daily standard. The PM mass would remain high if sulfates were removed. Combined with other evidence that has been reviewed, the concentration for May 30 is likely to have been significantly impacted by wildfire smoke. EPA concurs with the data flag applied to this concentration.

For August 4, the removal of organic carbon from the PM mass does not appear to reduce the level of the PM mass significantly and suggests a greater impact from sulfates on this day. Additionally, there was not other significant evidence to suggest that August 4 may have been impacted by local wildfires but rather a potential localized sulfate event or other sulfate source. Thus, EPA does not concur with flagging the concentration measured on this day.

PM_{2.5} Exceptional Events Technical Support Document

U.S. Environmental Protection Agency Region 4

Chattanooga, TN-GA Metropolitan Statistical Area

2005-2007

Introduction

This document provides U.S. Environmental Protection Agency (EPA) Region 4 rationale for concurrence or non-concurrence with exceptional event flags on the 24-hr average PM_{2.5} concentrations recorded at various Air Quality System (AQS) sites within the Chattanooga-Hamilton County Air Pollution Control Bureau Ambient Air Monitoring Network. The exceptional event flags that EPA Region 4 has concurred with will be excluded from use in determinations of exceedances and National Ambient Air Quality Standards (NAAQS) violations.

According to 40 CFR 50.1(j):

“Exceptional event means an event that affects air quality, is not reasonably controllable or preventable, is an event caused by human activity that is unlikely to recur at a particular location or a natural event, and is determined by the Administrator in accordance with 40 CFR 50.14 to be an exceptional event. It does not include stagnation of air masses or meteorological inversions, a meteorological event involving high temperatures or lack of precipitation, or air pollution relating to source noncompliance.”

§50.14(b)(2) also states:

“EPA shall exclude data from use in determinations of exceedances and NAAQS violations where a State demonstrates to EPA's satisfaction that emissions from fireworks displays caused a specific air pollution concentration in excess of one or more national ambient air quality standards at a particular air quality monitoring location and otherwise satisfies the requirements of this section. Such data will be treated in the same manner as exceptional events under this rule, provided a State demonstrates that such use of fireworks is significantly integral to traditional national, ethnic, or other cultural events including, but not limited to July Fourth celebrations which satisfy the requirements of this section.”

Finally, §50.14(c)(3)(iii) states:

“The demonstration to justify data exclusion shall provide evidence that:

- (A) The event satisfies the criteria set forth in 40 CFR 50.1(j);*
- (B) There is a clear causal relationship between the measurement under consideration and the event that is claimed to have affected the air quality in the area;*
- (C) The event is associated with a measured concentration in excess of normal historical fluctuations, including background; and*
- (D) There would have been no exceedance or violation but for the event.*

Each PM_{2.5} 24-hr average concentration requested for exclusion was first evaluated against these criteria using a two-step analysis. This analysis was designed to compare the requested value to historical values observed at the site and determine whether any exceedances could have been caused by the claimed event.

Step 1: Monthly Average Comparison

Using 24-hr PM_{2.5} data from AQS for 2004-2007, a comparison three-year monthly average was calculated. The three-year monthly average concentration was calculated excluding data from the year in which the data in question was collected. For example, a requested value in May

2006 was compared to the average of all the samples collected at the site during May 2004, May 2005, and May 2007. If the three-year average was greater than the annual PM_{2.5} NAAQS (15.0 µg/m³) and the requested value was less than the 24-hr PM_{2.5} NAAQS (35 µg/m³), then EPA concurrence was not given to the requested value. This is because in EPA's judgment there is insufficient evidence that "there would have been no exceedance or violation but for the event" as required by §50.14(c)(3)(iii)(D) because the normally expected concentration at the site (the three-year monthly mean concentration) is in excess of the NAAQS.

Step 2: Monthly 84th Percentile Comparison

Using 24-hr PM_{2.5} data from AQS for 2004-2007, a comparison three-year upper 84th percentile was calculated for the month in which the requested value was collected. The three-year monthly 84th percentile was calculated excluding data from the year in which the data in question was collected. For example, a requested value in May 2006 was compared to the upper 84th percentile calculated from all the samples collected at the site during May 2004, May 2005, and May 2007. The calculated three-year monthly upper 84th percentile was considered to represent the range of normally expected high values at that site due to normal local and background sources. If the requested value was below the calculated three-year monthly upper 84th percentile, EPA concurrence was not given to the requested value. This is because in EPA's judgment that there is insufficient evidence to demonstrate that the NAAQS exceedance was caused by the claimed event as required by §50.14(c)(3)(iii)(D) and not by normal local and background sources at the site.

If a requested value did not meet the requirements described in one or more of the above steps and the State did not submit compelling evidence to demonstrate that the event satisfied the exceptional event criteria, then EPA concurrence was not given to the exceptional event flag on the requested value. The values that did meet all of the conditions described above were then evaluated against the requirements of §50.14(c)(3)(iii). A summary of the approval or disapproval of all flagged data can be found in Appendix A.

Summary of Maps and Graphs Used

A variety of maps and graphs were used in this document. Unless otherwise noted, these products were obtained from the DATAFED Data Views Catalog, which can be accessed at http://datafedwiki.wustl.edu/index.php/Data_Views_Catalog. This includes maps using data from AQS, the National Aeronautics and Space Administration (NASA), and the Navy Aerosol Analysis and Prediction System (NAAPS). Some of the wind trajectories used in this document were obtained using the National Oceanic and Atmospheric Administration (NOAA) Hybrid Single-Particle Lagrangian Integrated Trajectory (HYSPLIT) utility, which can be accessed at <http://www.arl.noaa.gov/ready/hysplit4.html>. Also, unless otherwise noted, all ambient air monitoring data used in this analysis was obtained from the EPA AQS database. A summary of AQS site and parameter codes used in this document can be found in Appendix B.

The following discussion will demonstrate that the 24-hr average PM_{2.5} concentrations observed at various Chattanooga-Hamilton County Air Pollution Control Bureau network monitoring sites on the following dates meet or fail to meet the criteria laid out in the Exceptional Events Rule, §50.14.

EXCEEDANCE EVENT: Mexican Wildfires

Exceedance Date:	5/19/2005
MSA:	Chattanooga, TN-GA
Event Description:	Transport of smoke from Mexican wildfires.

Table 1: Site-specific information used in analysis, concentrations in $\mu\text{g}/\text{m}^3$

AQS ID	Date	Observed Concentration	Monthly Average	84 th Percentile	95 th Percentile	EPA Concurrence

47-065-4002-2	5/19/2005	33.8	15.9	21.3	26.5	NO ¹

Notes: ¹Three-year monthly average above $15.0\mu\text{g}/\text{m}^3$

Detailed Discussion of Evidence

A) Event Description

Documentation submitted by the Chattanooga-Hamilton County Air Pollution Control Bureau claims that smoke from wildfires in Mexico caused NAAQS exceedances at the site listed above. None of the requested values, however, passed both steps of the initial two-step analysis. Also, the documentation submitted by Chattanooga-Hamilton County did not demonstrate a clear causal relationship between the measured concentration and the event, and did not demonstrate that there would have been no exceedance or violation but for the event. Due to these reasons, no further analysis of these events is necessary. EPA concurrence was not given to these exceptional event flags.

EXCEEDANCE EVENT: Canadian, Alaskan, and United States Wildfires

Exceedance Dates:	6/21/2005, 6/24/2005, 6/27/2005, 6/30/2005, 7/3/2005
MSA:	Chattanooga, TN-GA
Event Description:	Long-range transport of smoke from Canadian and Alaskan wildfires.

Table 2: Site-specific information used in analysis, concentrations in $\mu\text{g}/\text{m}^3$

AQS ID	Date	Observed Concentration	Monthly Average	84 th Percentile	95 th Percentile	EPA Concurrence

Notes: ¹Three-year monthly average above 15.0 $\mu\text{g}/\text{m}^3$

Detailed Discussion of Evidence

A) Event Description

Documentation submitted by the Chattanooga-Hamilton County Air Pollution Control Bureau claims that smoke from Canadian wildfires north of the Great Lakes in Quebec and Ontario, combined with smoke from wildfires in Alaska caused NAAQS exceedances at the sites listed above. None of the requested values, however, passed both steps of the initial two-step analysis. Also, the documentation submitted by Chattanooga-Hamilton County did not demonstrate a clear causal relationship between the measured concentration and the event, and did not demonstrate that there would have been no exceedance or violation but for the event. Due to these reasons, no further analysis of these events is necessary. EPA concurrence was not given to these exceptional event flags.

EXCEEDANCE EVENT: Saharan Dust

Exceedance Dates:	7/24/05, 7/27/05
MSA:	Chattanooga, TN-GA
Event Description:	Long-range transport of dust from the Sahara Desert in Africa.

Table 3: Site-specific information used in analysis, concentrations in $\mu\text{g}/\text{m}^3$

AQS ID	Date	Observed Concentration	Monthly Average	84 th Percentile	95 th Percentile	EPA Concurrence
47-065-0031-1	7/24/2005	27.6	17.2	22.2	30.6	NO ¹
47-065-4002-1	7/24/2005	27.4	17.7	26.4	30.6	NO ¹
47-065-1011-1	7/27/2005	32.9	15.8	22.3	28.3	NO ¹
47-065-0031-1	7/27/2005	36.9	17.2	22.2	30.6	NO (sulfate)

Notes: ¹Three-year monthly average above $15.0\mu\text{g}/\text{m}^3$

Detailed Discussion of Evidence

A) Event Description

Documentation submitted by the Chattanooga-Hamilton County Air Pollution Control Bureau claims that long range transport of fine particulate dust from the Sahara Desert caused NAAQS exceedances at the sites listed above. The only requested value that passed both steps of the initial two-step analysis was the $36.9\mu\text{g}/\text{m}^3$ collected at the East Ridge site (AQS ID: 47-065-0031-1) on July 27, 2005. Figure 1 shows the National Aeronautics and Space Administration (NASA) Ozone Mapping Instrument (OMI) Satellite aerosol index observations for July 24th – 27th, 2005. These images do show evidence of long-range aerosol particulate transport across the Atlantic Ocean from Saharan Africa.

B) Causal Relationship Between the Event and Air Quality

In order to evaluate the impact of the event on air quality in Chattanooga, aerosol and $\text{PM}_{2.5}$ concentrations of soil-specific compounds were analyzed for July 27, 2005. Figures 2 and 3 show this analysis. Figure 2 shows the observed $\text{PM}_{2.5}$ concentration of soil particles. This map uses data from the $\text{PM}_{2.5}$ speciation network. Figure 3 uses data from the Navy Aerosol Analysis and Prediction System (NAAPS) and estimates the aerosol concentrations of dust present in the atmosphere. Neither figure indicates significant $\text{PM}_{2.5}$ concentrations from dust in the Chattanooga area.

Figure 4 shows $\text{PM}_{2.5}$ speciation data collected at the nearby Riverside (AQS ID: 47-065-4002) site collected during July and August, 2005. Speciation data collected on July 27, 2005 indicates elevated sulfate concentrations, which is indicative of $\text{PM}_{2.5}$ emissions from local stationary and mobile sources. Conversely, a large component of crustal material is not evident on this day, which does not support the claimed dust event. Figure 5 shows the spatially-averaged $\text{PM}_{2.5}$ sulfate concentrations on July 27. This map also shows a large sulfate event in the Chattanooga area on this day.

The lack of evidence of significant dust impact, combined with evidence of elevated sulfate levels, shows the elevated $PM_{2.5}$ levels observed at the East Ridge site on July 27, 2005 were not caused by a Saharan dust event. Therefore, EPA concurrence was not given to any of these exceptional event flags.

47-065-0031-1	8/26/2005	28.2	21.7	29.1	33.0	NO ¹

Notes: ¹Three-year monthly average above $15.0\mu\text{g}/\text{m}^3$

Detailed Discussion of Evidence

A) Event Description

Documentation submitted by the Chattanooga-Hamilton County Air Pollution Control Bureau claims that long range transport of smoke from wildfires in Alaska and northwestern Canada caused NAAQS exceedances at the sites listed above. The only requested concentrations that passed both steps of the initial two-step analysis were the $36.4\mu\text{g}/\text{m}^3$ and $36\mu\text{g}/\text{m}^3$ collected at the Riverside primary and collocated monitors on August 5, 2005.

B) Causal Relationship Between the Event and Air Quality

In order to evaluate the impact of the event on air quality in Chattanooga, wind trajectories were analyzed to assess the probability of smoke transport from the wildfires. Figure 5 shows a 48-hr backward trajectory for Chattanooga on August 5, 2005. This trajectory indicates air movement from the northeast down to Chattanooga, which does not support the claimed transport from the northwest.

To further analyze the possibility of impact from the fires, organic carbon (OC) concentrations were considered. $\text{PM}_{2.5}$ speciation data was not collected in the Chattanooga area on August 5, but Figure 6 shows the spatially averaged $\text{PM}_{2.5}$ organic carbon concentrations for the day. This map, however, does not indicate significant OC concentrations in the Chattanooga area.

Figure 7 shows spatially averaged $\text{PM}_{2.5}$ sulfate values for August 5, 2005. A widespread sulfate event is evident across the southeast U.S. on this day. This evidence shows that the elevated $\text{PM}_{2.5}$ levels observed at the Riverside site on July 27, 2005 were not caused by a Saharan dust event. Therefore, EPA concurrence was not given to any of these exceptional event flags.

47-065-0031-1	9/13/2005	35.8	17.8	25.6	31.2	NO (sulfate)

Notes: ¹Three-year monthly average above $15.0\mu\text{g}/\text{m}^3$

Detailed Discussion of Evidence

A) Event Description

According to documentation submitted by the Chattanooga-Hamilton County Air Pollution Control Bureau, long range transport of smoke from wildfires in Idaho and Montana caused NAAQS exceedances at the sites listed above. The only requested concentrations that passed both steps of the initial two-step analysis were the values collected on September 13, 2005 at the Riverside, East Ridge, and Soddy Daisy (AQS ID: 47-065-1011) sites.

B) Causal Relationship Between the Event and Air Quality

To evaluate the possible causal relationship of the event on air quality in Chattanooga, wind trajectories were analyzed to assess the probability of smoke transport from the wildfires. Figure 8 shows a 48-hr backward trajectory for Chattanooga on September 13, 2005. These trajectories do indicate some air movement from the northwestern U.S. to Chattanooga, which supports the claimed transport from the northwest.

PM_{2.5} speciation data collected on September 13, 2005, however, does not support the supposed smoke impact. High sulfate concentrations are evident on September 13th, as illustrated in Figure 9. This graph also indicates that organic carbon levels were not significantly above the normally expected range. Figure 10 shows very low PM_{2.5} organic carbon concentrations across the southeast on this day, and does not even indicate elevated high OC levels in the claimed source region. Conversely, Figure 11 illustrates a widespread sulfate event across the eastern U.S. on this day. These observations show that the elevated PM_{2.5} concentrations observed in Chattanooga on September 13, 2005 were most likely caused by emissions from local stationary and mobile sources, and that the air quality was not significantly influenced by wildfires in the

northwest. EPA concurrence was not given to any of the exceptional event flags related to this event.

Notes: ¹Three-year monthly average above $15.0\mu\text{g}/\text{m}^3$

Detailed Discussion of Evidence

A) Event Description

Documentation submitted by the Chattanooga-Hamilton County Air Pollution Control Bureau claims that long range transport of smoke from wildfires in central Canada caused NAAQS exceedances at the sites listed above. None of the requested values, however, passed both steps of the initial two-step analysis. Also, the documentation submitted by Chattanooga-Hamilton County did not demonstrate a clear causal relationship between the measured concentration and the event, and did not demonstrate that there would have been no exceedance or violation but for the event. Due to these reasons, no further analysis of these events is necessary. EPA concurrence was not given to any of these exceptional event flags.

EXCEEDANCE EVENT: Independence Day Fireworks Displays

Exceedance Date:	7/4/2006
MSA:	Chattanooga, TN-GA
Event Description:	Local fireworks displays in celebration of Independence Day holiday.

Table 7: Site-specific information used in analysis, concentrations in $\mu\text{g}/\text{m}^3$

AQS ID	Date	Observed Concentration	Monthly Average	84 th Percentile	95 th Percentile	EPA Concurrence
47-065-0031-1	7/4/2006	49.2	17.0	22.3	30.4	YES
47-065-4002-2	7/4/2006	38.6	16.0	22.1	26.9	YES
47-065-4002-1	7/4/2006	38.5	16.4	24.3	27.2	YES
47-065-1011-1	7/4/2006	37.1	16.2	22.2	27.2	YES

Detailed Discussion of Evidence

A) Event Description

Documentation submitted by the Chattanooga-Hamilton County Air Pollution Control Bureau claims that fireworks displays around the Chattanooga area caused NAAQS exceedances at the above sites. 24-hr NAAQS exceedances were observed at the East Ridge, Riverside, and Soddy Daisy sites. All four values passed both steps of the initial two-step analysis. $\text{PM}_{2.5}$ speciation data collected on July 4, 2006 at the Riverside and Rossville sites showed significantly elevated levels of $\text{PM}_{2.5}$ Strontium and Potassium, which according to Perry (1999) and Vecchi et al. (2008), is correlated with particulate matter emissions from fireworks. Figure 12 shows a map of the Chattanooga area, including monitoring sites and permitted fireworks displays on July 4, 2006. Permits issued for each of these fireworks displays can be found in Appendix C. Figure 13 shows 24-hour average $\text{PM}_{2.5}$ concentrations for the East Ridge site for June – August 2006. A peak can be seen in this figure on July 4th. Figure 14 shows the AIRNOW 24-hr average $\text{PM}_{2.5}$ concentrations measured across the southeastern United States on July 4, 2006.

Figure 12: Chattanooga, TN monitoring sites and fireworks displays, July 4, 2006.

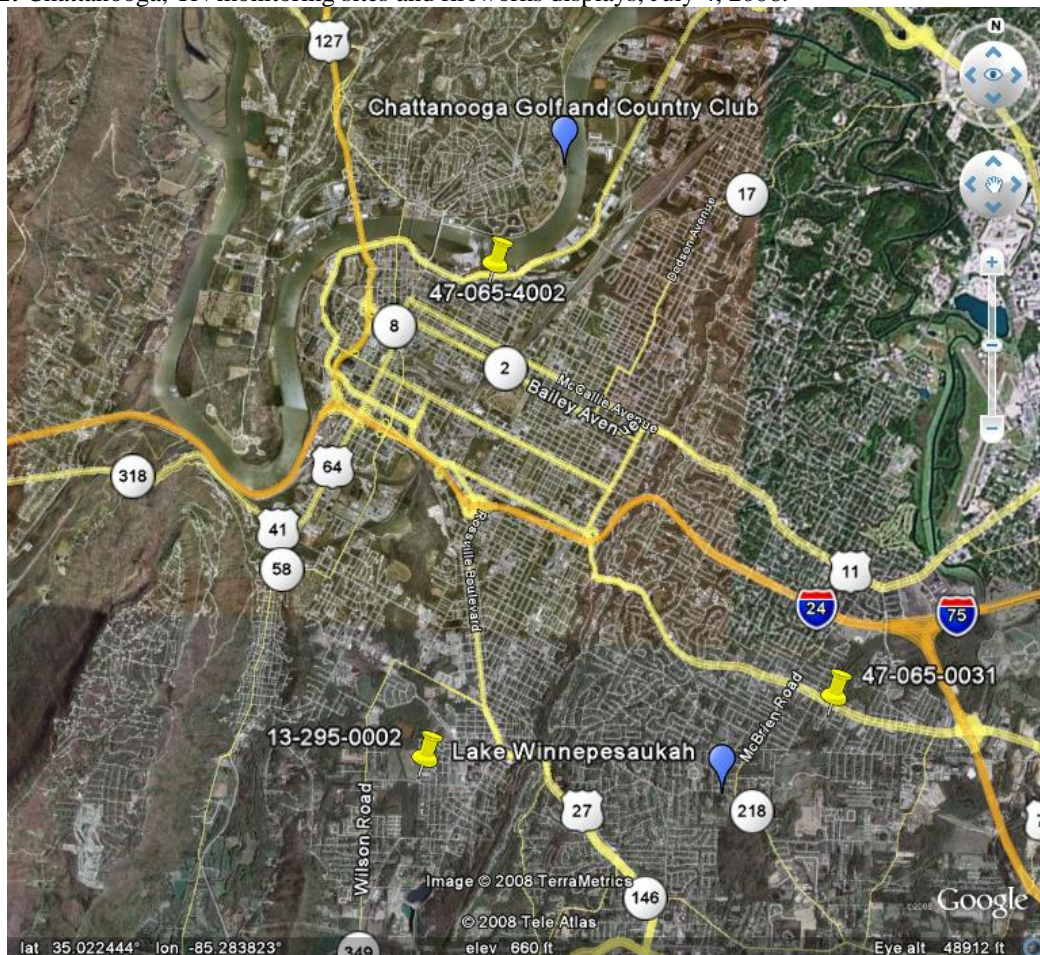

Figure 13: 24-hour average $PM_{2.5}$ concentrations collected by Federal Reference Method (FRM) at the East Ridge site during June – August 2006.

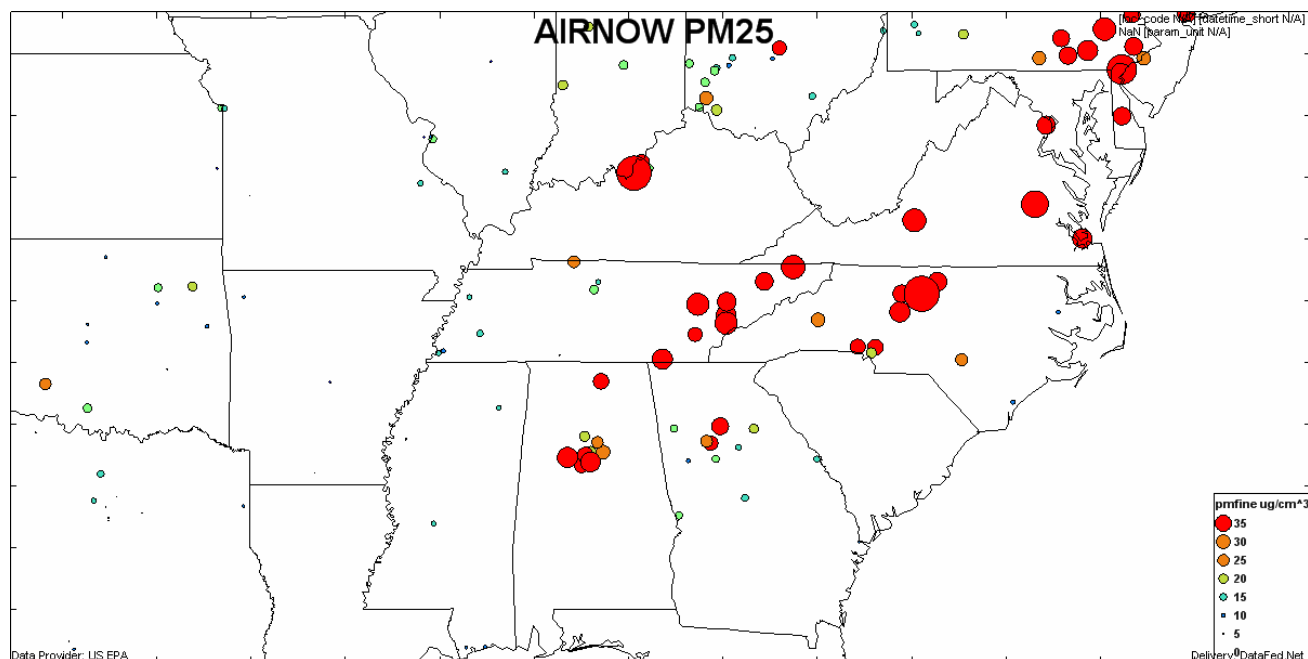

Figure 14: 24-hr average $PM_{2.5}$ concentrations reported to AIRNOW across the southeastern US on July 4, 2006.

B) Causal Connection Between the Event and Air Quality

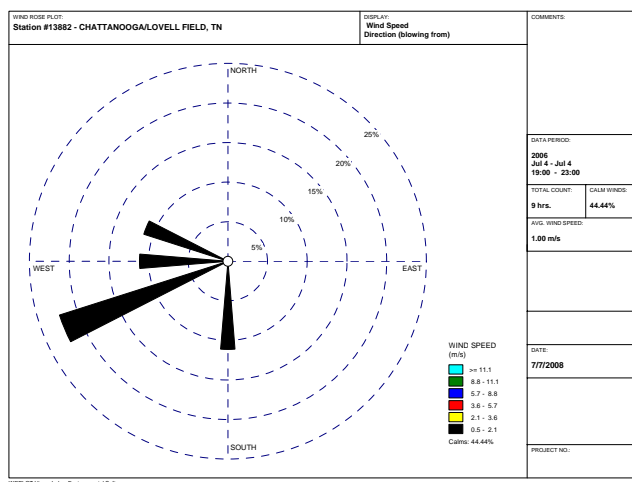

A causal connection between the fireworks displays and the observed exceedance of the PM_{2.5} NAAQS is demonstrated by using PM_{2.5} speciation data collected on July 4th in the Chattanooga area, and by comparing the value observed on July 4, 2006 to the historical values measured at the site. Figure 15 shows the PM_{2.5} strontium values collected at the nearby Riverside and Rossville sites during 2006. Both sites observed a spike of PM_{2.5} strontium concentrations on July 4, 2006. According to Perry (1999) and Vecchi et al. (2008), strontium is widely used in fireworks to create red coloring, and is normally present in the atmosphere at very low levels. According to Vecchi et al. (2008), “Sr was recognized as the best fireworks tracer because its concentration was very high during the [fireworks] event and lower than, or comparable with, minimum detection limits during other time intervals, indicating that it was mainly due to pyrotechnic displays.”

Figure 15: PM_{2.5} strontium concentrations observed at Riverside and Rossville sites during 2006.

The causal relationship between fireworks displays and the elevated PM_{2.5} levels at the East Ridge site is strengthened upon consideration of local meteorological conditions on July 4, 2006. Figure 16 displays a wind rose for July 4th based on measurements taken at Lovell Field in Chattanooga. The wind rose shows that the prevailing wind on the night of July 4, 2006 was from the southwest. This indicates that the East Ridge site was directly downwind of the permitted fireworks display at Lake Winnepesaukah (See Figure 12 and Appendix C).

Figure 16: Wind rose from Lovell Field in Chattanooga for 7:00 PM to 12:00 AM on July 4, 2006.

C) Comparison to Historical Levels

The next step in determining whether the data collected at the East Ridge site on July 4, 2006 is to determine how unusual the measured $PM_{2.5}$ concentration was. Figure 17 shows all 24-hr average $PM_{2.5}$ measurements collected at the East Ridge site from 2003-2006. Values collected each year from June 19 – July 19 each year (the 30-day period centered around the event) are shown in yellow. As the figure illustrates, not only is this value the maximum value observed at this site over the three year period, it is also well above the normal range of values observed during this time period each year.

Figure 17: 24-hr $PM_{2.5}$ values collected during 2003-2006 at the East Ridge Site

Figures 18, 19, and 20 show the spatially averaged normal high values for 24-hour $PM_{2.5}$ concentrations across the southeastern US, and how the observed values on July 4, 2006 compare to these normal high values. Figure 18 shows the 84th percentile 24-hour $PM_{2.5}$ concentrations observed across the southeast during 2004-2006. These values were interpreted to represent the high end of normally observed values. Figure 19 shows the difference between 24-hour $PM_{2.5}$ concentrations observed on July 4, 2006 and the 84th percentile concentrations for 2004-2006. This map shows values about $20\mu g/m^3$ above the normal high values in the Chattanooga area. Figure 20 shows a similar comparison as Figure 19, except Figure 20 shows the difference between observed concentrations and the 95th percentile concentrations for 2004-2006. Again, this map shows values about $10\mu g/m^3$ above the 95th percentile values for 2004-2006. These figures demonstrate that the 24-hour average $PM_{2.5}$ concentrations measured at the East Ridge site on this day were in fact unusual and well above background or normal high levels. This conclusion is also supported by the elevated $PM_{2.5}$ strontium levels observed on July 4th (see Figure 15), which are also above background or normal high levels.

Figure 18: 84th percentile “normal high” 24-hr PM_{2.5} values, 2004-2006

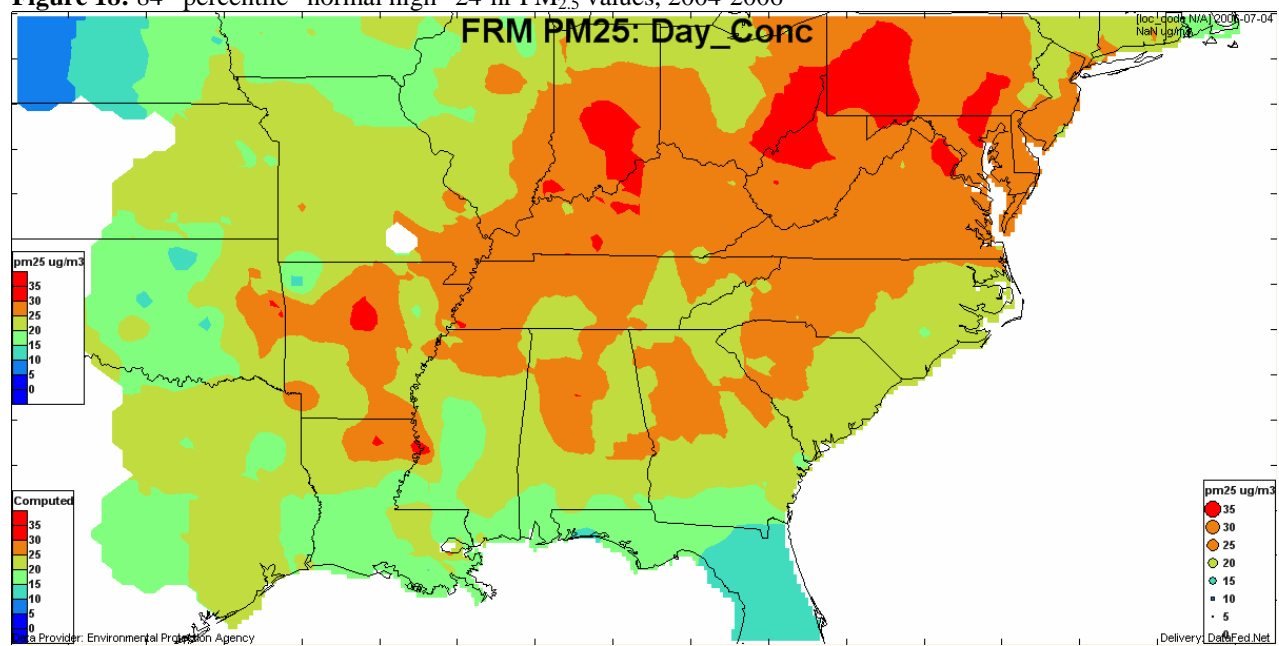

Figure 19: Values above 84th percentile 24-hr PM_{2.5} values on July 4, 2006

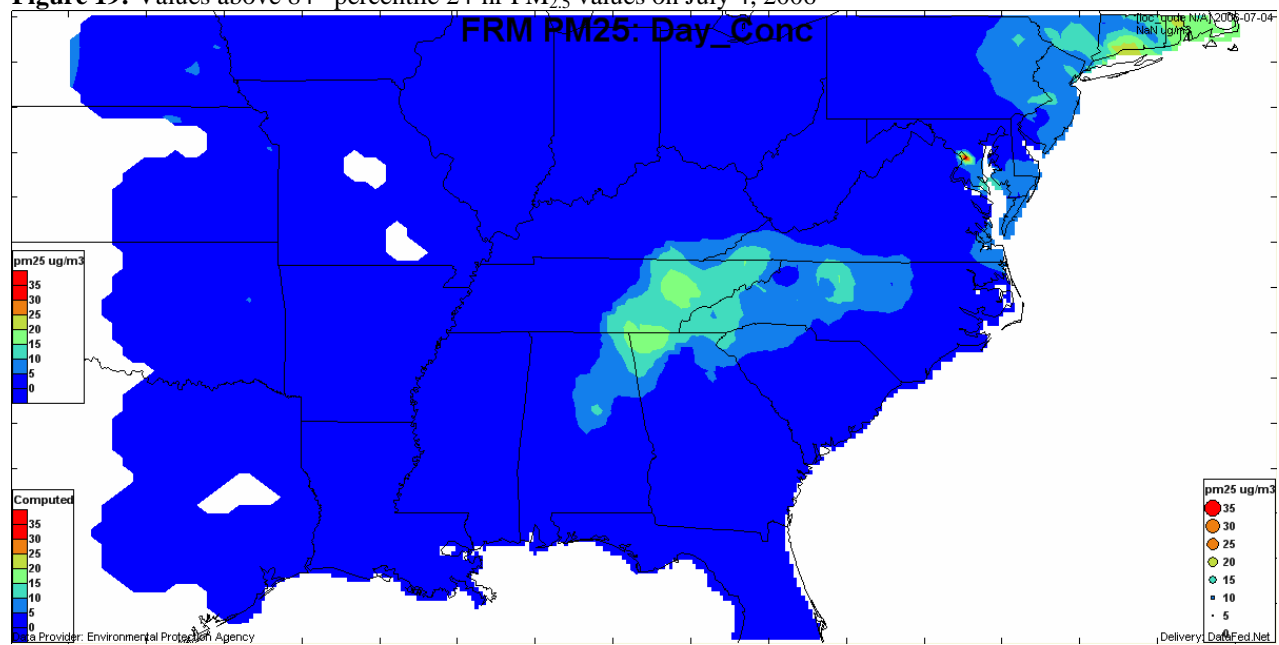

Figure 20: Values above 95th percentile 24-hr PM_{2.5} values on July 4, 2006

D) Demonstration of No Exceedance “But For” the Event

In order to corroborate the estimated 10-20 $\mu\text{g}/\text{m}^3$ increment over historically high values, a PM_{2.5} source apportionment analysis was conducted using PM_{2.5} speciation data collected on July 4, 2006 at the nearby Riverside and Rossville sites, and using fireworks source apportionment data collected by Perry (1999).

First, PM_{2.5} Speciation data for the Riverside site was collected for June 22 – July 19, 2006 from EPA’s Air Explorer website, which uses data from the EPA Air Quality System (AQS) database. Data for the Rossville site was not available on Air Explorer, and so was obtained directly from AQS. Speciation data collected at the Rossville site on June 22, 2006 was not used due to QA concerns (the PM_{2.5} mass measured by the PM_{2.5} speciation sampler was 28.4 $\mu\text{g}/\text{m}^3$ higher than the value measured by the FRM sampler at the site). Next, data collected by Perry (1999) on the percent variance in PM_{2.5} mass explained by each of three source categories (fireworks, wind-blown soil, and other sources) for each of 18 PM_{2.5} speciated parameters (Al, Ba, Br, Ca, Cu, Fe, K, Mg, Mn, Na, Pb, S, Si, Sr, Ti, V, Zn, and Soot) was identified. This data was based on PM_{2.5} speciation data collected from July 1 – 7, 1990 across western Washington State. The application of data collected in a different region of the country to data collected in the southeast is a potential source of uncertainty. For purposes of this analysis, however, it was assumed that the total aerosol mixture observed by Perry (1999) was of similar composition to the mixture observed in Chattanooga during this event.

Next, for each day that PM_{2.5} speciation data was collected during June 19 – July 19, 2006, a PM_{2.5} strontium ratio was calculated by dividing the measured PM_{2.5} strontium mass on a given day by the measured PM_{2.5} strontium mass at that site on July 4th. The purpose of this calculation was to quantify the relative impact of PM_{2.5} from fireworks on different days. Next, a PM_{2.5} mass apportionment was conducted for each measured speciation component for each day that speciation data was available. This was accomplished using the following equation:

$$M_{\text{source}} = \%V_{\text{source}} \times M_{\text{measured}} \quad (\text{Eq. 1})$$

Where M_{source} is the mass of a specific $\text{PM}_{2.5}$ speciated component attributed to a source (i.e. fireworks, wind-blown soil, or other), $\%V_{\text{source}}$ is the percent variance that is explained by the source, obtained from Perry (1999), and M_{measured} is the measured $\text{PM}_{2.5}$ mass of the speciated component. This analysis was conducted for each of the 18 speciated components discussed in Perry (1999). Because no data was available for the $\%V_{\text{source}}$ values for sulfate mass, the $\%V_{\text{source}}$ values for elemental sulfur were used, assuming that sulfur mass and sulfate mass are directly proportional. Also, the $\%V_{\text{source}}$ values calculated by Perry (1999) for soot were used for both elemental and organic carbon. For all other speciated parameters for which no $\%V_{\text{source}}$ values were available, the mass was assumed to be entirely from “other sources.”

One limitation of this analysis method is that the $\%V_{\text{source}}$ values for each of the three source categories do not add up to 100%. As a result, the entire $\text{PM}_{2.5}$ mass observed could not be directly accounted for (mean unaccounted mass fraction = 30.3%). To compensate for this problem, the percentage of the accounted mass was calculated for each of the three sources. The unaccounted mass (observed $\text{PM}_{2.5}$ mass – accounted mass) was then apportioned according to these percentages.

The final step in the source apportionment calculations was to account for day to day variability of source categories. Due to the fact that fireworks were only a documented source on July 4th, the $M_{\text{fireworks}}$ calculated for each day was multiplied by the $\text{PM}_{2.5}$ strontium ratio described above, in order to quantify the relative significance of fireworks as an emissions source on different days. The resulting value for each sample was considered the final $\text{PM}_{2.5}$ mass attributed to fireworks. A leftover mass was then calculated by subtracting the final mass attributed to fireworks from the $M_{\text{fireworks}}$. This leftover mass was then added to the “other sources” category. In order to estimate the source apportionment for the East Ridge site, the mass percentages calculated for the Riverside and Rossville sites were averaged for each day and applied to the $\text{PM}_{2.5}$ mass measured at the East Ridge site. The resulting source apportionment analysis is shown in Figure 21. This figure demonstrates that this event satisfies the requirement of §50.14(c)(3)(iii)(D) that “there would have been no exceedance or violation but for the event.”

EPA concurrence was given to all four of the requested values on this day. The above discussion and documentation provides sufficient evidence that each of these four values satisfies all of the criteria required by the exceptional events rule, and may be excluded from use in determinations of exceedances and NAAQS violations

Figure 21: PM_{2.5} Source apportionment for June 22 – July 16, 2006. PM_{2.5} mass data for the Riverside and Rossville sites is from the PM_{2.5} speciation sampler. PM_{2.5} mass data for the East Ridge site is from the Federal Reference Method (FRM) sampler.

EXCEEDANCE EVENT: Northwestern U.S. and Canadian Fires

Exceedance Date:	8/18/06, 8/24/06, 9/11/06
MSA:	Chattanooga, TN-GA
Event Description:	Long-range transport of smoke from wildfires in the northwestern U.S. and Canada

Notes: ¹Three-year monthly average above $15.0\mu\text{g}/\text{m}^3$

Detailed Discussion of Evidence

A) Event Description

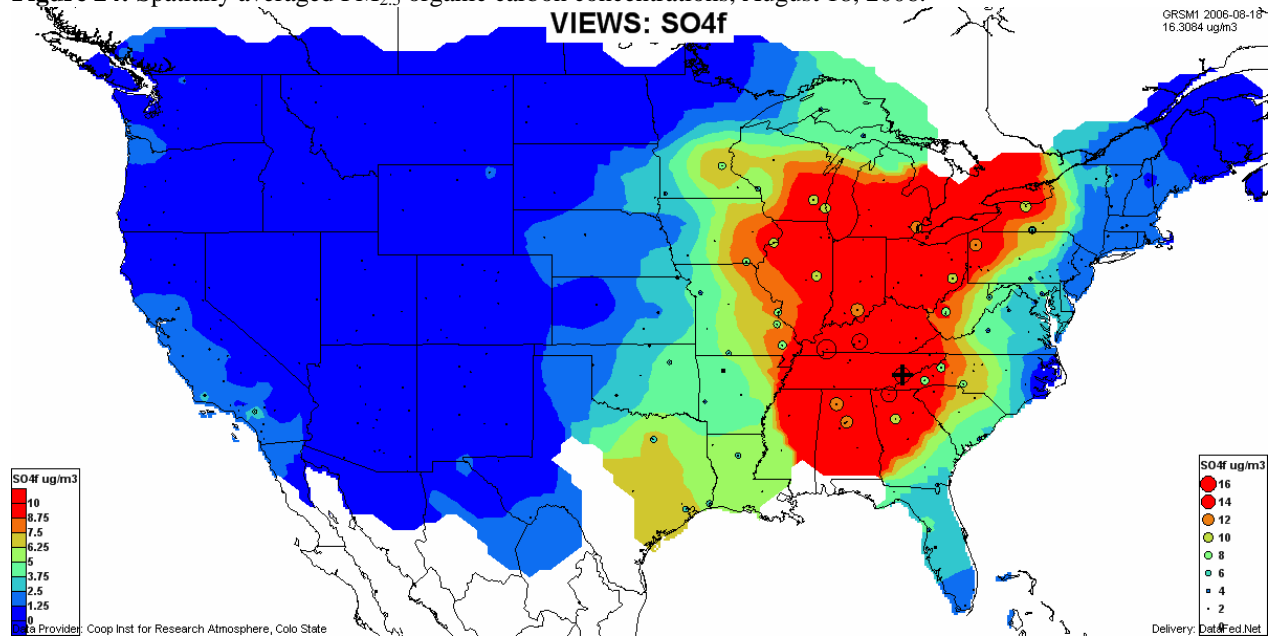

Documentation submitted by the Chattanooga-Hamilton County Air Pollution Control Bureau claims that long range transport of smoke from wildfires in western Canada and the northwestern U.S. caused NAAQS exceedances at the sites listed above. The only requested concentrations that passed both steps of the initial two-step analysis were the values collected on August 18, 2006 at the Riverside site.

B) Causal Relationship Between the Event and Air Quality

To evaluate the possible causal relationship of the event on air quality in Chattanooga, wind trajectories were analyzed to assess the probability of smoke transport from the wildfires. Figures 22a and 22b show backward trajectories for Chattanooga on August 18, 2006. 48-hr trajectories are shown in Figure 22a, while 96-hr trajectories are shown in Figure 22b. These trajectories indicate air movement from the northeastern U.S. to Chattanooga, which does not support the claimed transport of smoke from the northwest U.S. and Canada.

In order to more accurately assess the possible impact of smoke on this day, however, $\text{PM}_{2.5}$ organic carbon and sulfate levels were considered. No $\text{PM}_{2.5}$ speciation was collected in the Chattanooga area on August 18, 2006, so spatially averaged maps were used to assess the possible impacts of smoke on air quality. Figure 23 shows the observed $\text{PM}_{2.5}$ organic carbon levels on August 18th, and Figure 24 shows the observed $\text{PM}_{2.5}$ sulfate levels. These figures show high levels of organic carbon in the claimed source area, but relatively low levels near Chattanooga. Also, high sulfate levels are evident across the eastern U.S., which shows that these NAAQS exceedances are due to local and regional stationary and mobile sources, and were

Figure 24: Spatially averaged PM_{2.5} organic carbon concentrations, August 18, 2006.

EXCEEDANCE EVENT: Local and Southeastern U.S. Fires

Exceedance Date:	3/8/07, 3/9/07, 3/10/07, 3/11/07
MSA:	Chattanooga, TN-GA
Event Description:	Smoke from local wildfires and wildfires around the southeast

47-065-4002-2	3/10/2007	23.5	11.3	14.9	18.8	NO
47-065-0031-1	3/11/2007	23.6	12.2	17.5	20.2	NO

Detailed Discussion of Evidence

A) Event Description

Documentation submitted by the Chattanooga-Hamilton County Air Pollution Control Bureau claims that smoke from wildfires in the counties surrounding Chattanooga and from wildfires around the southeast U.S. caused NAAQS exceedances at the sites listed above. All of the requested values passed both steps of the initial two-step analysis.

B) Causal Relationship Between the Event and Air Quality

PM_{2.5} speciation data was not collected in the Chattanooga area during the claimed event, from March 8 – 11, 2007. Figure 25 shows speciation data collected during the month of March for 2004-2007. Slightly higher than normal levels of organic carbon were observed on other days of March 2007, suggesting possible impacts from fires.

Next, aerosol smoke and sulfate maps from the NAAPS satellite were analyzed for the time period in question. Some aerosol smoke was observed in the southeast on these days, although none is evident in the Chattanooga area, as illustrated by figure 26. Figure 27 shows aerosol sulfate maps for the same time period. These maps show moderate sulfate levels in the Chattanooga area.

C) Comparison to Historical Levels

In order to further evaluate the impacts due to fires, data collected from March 8 -11 was compared to background levels. Figure 28 displays all of the 24-hr PM_{2.5} concentrations collected in the Chattanooga area during 2004-2007. Samples collected during the month of March are shown in light blue, and samples collected during the rest of the year are shown in dark blue. The values requested to be excluded due to the local and southeast are shown in red.

As this figure illustrates, these values are in the high end of values collected in March, but appear to be within the range of normally observed values.

Figures 29, 30, and 31 show the spatially averaged normal high values for 24-hour $PM_{2.5}$ concentrations across the southeastern US, and how the observed values on March 8-11, 2007 compare to these normal high values. Figure 29 shows the observed 24-hour $PM_{2.5}$ concentrations across the southeast during March 8-11. Figure 30 shows the difference between 24-hour $PM_{2.5}$ concentrations observed on March 8-11 and the 84th percentile concentrations observed during the month of March for 2004-2006. These maps show concentrations about 5-10 $\mu g/m^3$ above the 84th percentile. Figure 31 shows a similar comparison as Figure 30, except Figure 31 shows the difference between observed concentrations and the 95th percentile concentrations for 2004-2006. These maps show values slightly above the 95th percentile in the Chattanooga area on March 9-10.

Although the 24-hr average $PM_{2.5}$ concentrations observed during March 8-11 were slightly elevated, there is no definitive evidence that these NAAQS violations were caused by smoke impacts. $PM_{2.5}$ speciation data was not collected on these days (see figure 25), and NAAPS aerosol smoke maps do not show significant concentrations on any of the days in question (see figure 26). Also, the documentation submitted by Chattanooga-Hamilton County did not demonstrate a clear causal relationship between the measured concentration and the event, and did not demonstrate that there would have been no exceedance or violation but for the event. Due to these reasons, EPA concurrence was not given to any exceptional event flags during this event.

Notes: ¹Three-year monthly average above $15.0\mu\text{g}/\text{m}^3$

Detailed Discussion of Evidence

A) Event Description

Documentation submitted by the Chattanooga-Hamilton County Air Pollution Control Bureau claims that smoke from a local wildfire on Signal Mountain northwest of Chattanooga caused NAAQS exceedances at the sites listed above. All of these values passed both steps of the initial two-step analysis. The fire was well documented in the *Chattanooga Times Free Press*, and articles submitted to EPA by Chattanooga-Hamilton County are contained in Appendix D. Figure 32 shows a map of the location of the Signal Mountain fire relative to the affected monitoring sites. The fire was approximately 8 miles northwest of the Riverside site, which measured the highest concentration during the event.

B) Causal Relationship Between the Event and Air Quality

$\text{PM}_{2.5}$ speciation data was collected at the Riverside and Rossville sites on March 25, 2007, the day that the highest concentration was recorded during the event. Figure 33 shows speciation data collected during the month of March for 2004-2007. A peak of organic carbon is shown on March 25th, indicating impact from the fire. Also, documentation of the fire in the *Chattanooga Times Free Press* helps establish the causal link.

Next, spatially averaged $\text{PM}_{2.5}$ organic carbon and sulfate maps were analyzed for March 25, 2007. Figure 34 shows the spatially averaged $\text{PM}_{2.5}$ organic carbon concentrations, and Figure

35 shows the PM_{2.5} sulfate levels. These maps do not indicate significant levels of organic carbon or sulfates in the region surrounding Chattanooga. This is consistent, however, with the small scale of the event in question.

C) Comparison to Historical Levels

In order to further assess the impacts of the Signal Mountain fire, the data in question was compared to historical levels observed at each site. Table 10 shows that all of the values flagged except the concentration at the East Ridge site on March 29th are greater than the 95th percentile calculated from data collected during the month of March for 2004-2006. This is good evidence that the data were influenced by an exceptional event. Figure 36 shows the spatially averaged 24-hr average PM_{2.5} concentrations observed on March 25, 2007, and the excess PM_{2.5} levels above the historical 84th and 95th percentiles. These maps show that the observed PM_{2.5} concentrations in Chattanooga were significantly above the historical 84th percentile and slightly above the historical 95th percentile.

D) Demonstration of No Exceedance “But For” the Event

In order to quantify the impacts of the fire on observed PM_{2.5} concentrations, speciation data collected at the Riverside site on March 25, 2007 was used to approximate the organic mass increment of the observed PM_{2.5} mass that was caused by the wildfire. The organic mass increment was calculated using the following equation, adapted from Turpin and Lim (2001).

$$OMI = (OC_{observed} - OC_{average}) \times 2.0 \quad (Eq. 2)$$

Where OMI is the organic mass increment due to smoke from the wildfire, OC_{observed} is the observed organic carbon mass, and OC_{average} is the average organic carbon mass observed at the site during the month of March for 2004-2006. A multiplier of 2.0 is used to approximate the total PM_{2.5} mass associated with smoke from wildfires (Turpin and Lim 2001). In order to approximate the PM_{2.5} concentration that would have been observed but for the fire, the OMI was subtracted from the observed 24-hr average PM_{2.5} concentration. This procedure was then repeated for each day that PM_{2.5} speciation data was collected during March 2007 to compare impacts of smoke on different days. The results of this analysis are shown in Figure 37. This figure shows the calculated OMI and the adjusted PM_{2.5} mass (Observed PM_{2.5} – OMI). The graph demonstrates that without the PM_{2.5} mass emitted by the fire on March 25, 2007, the 24-hr average PM_{2.5} concentration would have been approximately 14.9µg/m³, and thus that there would have been no exceedance but for the wildfire.

Since the highest recorded value during the event (32.7 µg/m³ at the Riverside site on 3/25) met all of the requirements for exclusion from NAAQS calculations under the exceptional events rule, it can be assumed that the other requested values were similarly impacted by the wildfire, even though speciation data was not collected on these days. The overall body of evidence shows that there would have been no NAAQS exceedances during this period but for the Signal Mountain wildfire. EPA concurrence was given to all of the values requested during this event.

Detailed Discussion of Evidence

A) Event Description

Documentation submitted by the Chattanooga-Hamilton County Air Pollution Control Bureau claims that smoke from wildfires in Georgia and Florida caused NAAQS exceedances at the sites listed above. The values that passed both steps of the initial two-step analysis were the concentrations collected at the East Ridge site on May 22, 27, 28, 31, and June 1, and the Riverside site on May 27.

The Bugaboo Scrub Fire (Figure 38a) was a wildfire that occurred from April to June in 2007 and ultimately became the largest fire in the history of both Georgia and Florida. The Bugaboo, which was not actually named until it had burned for nearly a month, started in the Okefenokee Swamp, most of which is located in Georgia. It was previously known as the Sweat Farm Road Fire, which merged with the Big Turnaround Complex fire (Figure 38b). Due to the amount of acreage consumed from these wildfires, copious smoke impacted sites around Region 4 from

May through the first week of June, in many cases causing very large increases in the 24 hour $PM_{2.5}$ mass.

B) Causal Relationship Between the Event and Air Quality

$PM_{2.5}$ speciation data was not collected in the Chattanooga area on any of the days under consideration. Other sites in Region 4, however, were able to definitively demonstrate a causal relationships between the wildfires and regional air quality for the same time period.

In order to more accurately assess the possible impact of smoke on this day, however, wind trajectories were analyzed for each of the requested days. Figure 39 illustrates 48-hr backward wind trajectories for each of the days under consideration. Figure 40 shows wind trajectories that passed through the claimed source region in southern Georgia and northern Florida on each day. These trajectories support the possible transport of smoke to Chattanooga on these days. Figure 41 depicts the NASA OMI aerosol index observed on each of the days in question, and confirms high aerosol particulate concentrations in southern Georgia and northern Florida.

Next, $PM_{2.5}$ organic carbon and sulfate levels were analyzed. Spatially averaged maps were used to assess the possible impacts of smoke on air quality since $PM_{2.5}$ speciation data was not available. Figure 42 shows the observed $PM_{2.5}$ organic carbon levels for each of the days in question, and Figure 43 shows the observed $PM_{2.5}$ sulfate levels. Though these maps are somewhat inconclusive, they do show some smoke impact, particularly on May 22.

C) Comparison to Historical Levels

In order to further assess the impacts of the Georgia and Florida fires, the data in question was compared to historical levels observed at each site. Table 11 shows that all of the values that passed both steps of the initial two-step analysis are significantly greater than the 95th percentile calculated from data collected during the month of May for 2004-2006. This evidence shows that the data were influenced by an exceptional event. Figure 44 shows the spatially averaged 24-hr average $PM_{2.5}$ concentrations observed on each of the days in question. Figures 45 and 46 show the excess $PM_{2.5}$ concentrations observed above the 84th and 95th percentiles, respectively, on each of the days. These maps show 24-hr average $PM_{2.5}$ concentrations above the normal range of values observed in the Chattanooga area during the month of May in the past.

D) Demonstration of No Exceedance “But For” the Event

Since no $PM_{2.5}$ speciation data was collected on any of the days in question, an organic mass apportionment was not possible. For the violations of the 24-hr $PM_{2.5}$ standard ($35\mu g/m^3$), however, each value was between $12.1\mu g/m^3$ and $21.3\mu g/m^3$ in excess of the historical 95th percentile for the respective site in the month of May. This is an indication that these monitors were significantly impacted by the fires, and that there would have been no exceedance of the 24-hr standard but for the event. EPA concurrence was given to all of the flagged values during the event that exceeded the 24-hr NAAQS of $35\mu g/m^3$.

Without $PM_{2.5}$ speciation data for any of the requested values below the 24-hr standard, there is not enough evidence that there would have been no exceedance (of the annual NAAQS of $15.0\mu g/m^3$) but for the fires. Also, because all of the historical three-year monthly averages for

A large fire is burning, with thick black and white smoke billowing into the sky. The smoke is dense and voluminous, filling much of the frame. In the foreground, there is a line of trees and a dirt road. The fire itself is visible at the base of the smoke plume, with bright orange and yellow flames. The overall scene is dramatic and intense.

An aerial photograph showing a large fire burning in a forested area. A massive plume of white smoke rises from the fire, filling the upper half of the frame. The foreground consists of a cleared, grassy area with a dirt road or path running across it. The date 'APR 26 2007' is stamped in red in the bottom right corner.

Detailed Discussion of Evidence

A) Event Description

Documentation submitted by the Chattanooga-Hamilton County Air Pollution Control Bureau claims that long range transport of smoke from wildfires in northeast Canada caused NAAQS exceedances at the sites listed above. None of the requested values, however, passed both steps of the initial two-step analysis. Also, the documentation submitted by Chattanooga-Hamilton County did not demonstrate a clear causal relationship between the measured concentration and the event, and did not demonstrate that there would have been no exceedance or violation but for the event. Due to these reasons, no further analysis of these events is necessary. EPA concurrence was not given to any of these exceptional event flags.

EXCEEDANCE EVENT: Saharan Dust

Exceedance Dates:	6/24/07, 6/25/07, 6/26/07
MSA:	Chattanooga, TN-GA
Event Description:	Long-range transport of dust from the Sahara Desert in Africa

Detailed Discussion of Evidence

A) Event Description

Documentation submitted by the Chattanooga-Hamilton County Air Pollution Control Bureau claims that long range transport of smoke from wildfires in Idaho and Montana caused NAAQS exceedances at the sites listed above. The only requested concentrations that passed both steps of the initial two-step analysis, however, were the values collected on August 4, 2007 and August 19, 2007.

B) Causal Relationship Between the Event and Air Quality

To evaluate the possible causal relationship of the event on air quality in Chattanooga, wind trajectories were analyzed to assess the probability of smoke transport from the wildfires. Figure 47 shows 48-hr backward trajectories for Chattanooga on August 4th and 19th. These trajectories, however, do not support significant air transport from the northwest. Figure 48 shows the NASA OMI aerosol concentrations observed on each day. This figure does confirm high aerosol concentrations in the claimed source region.

PM_{2.5} speciation data collected on August 4, 2007 does not support the supposed smoke impact. High sulfate concentrations are evident on August 4th, as illustrated in Figure 49. This graph also indicates that organic carbon levels were not significantly above the normally expected range. No PM_{2.5} speciation data was collected on August 19th.

Since speciation data was not available for August 19, 2007, NAAPS aerosol smoke and sulfate maps were used instead as an indicator of possible smoke impact (Figures 50 and 51). Figure 50 shows aerosol smoke levels on August 19th, and does not indicate significant levels in the Chattanooga area. Figure 51, however, does show a moderate sulfate event on this day centered around the Chattanooga area.

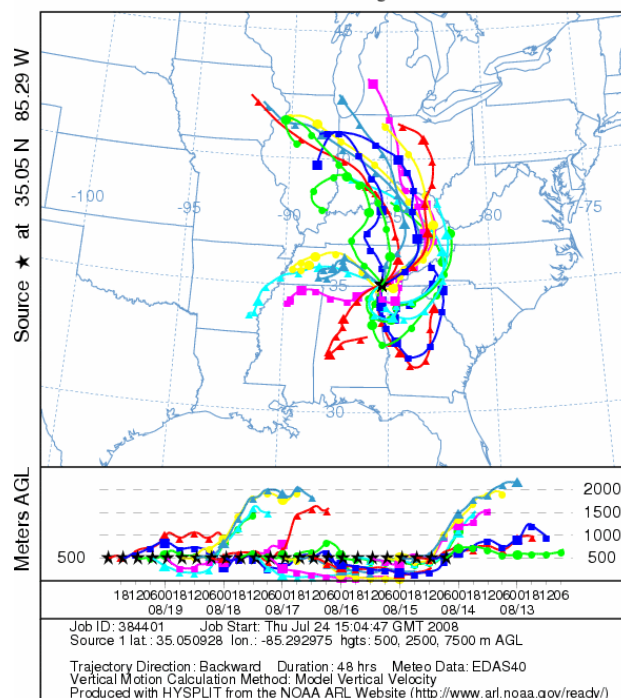

The evidence discussed above shows that on both August 4, 2007, and August 19, 2007, the Chattanooga area was not significantly impacted by smoke from the northwestern wildfires. Speciation and satellite aerosol data show, rather, that these NAAQS exceedances were more likely driven by elevated PM_{2.5} sulfate levels, indicating impact from local stationary and mobile sources. Also, the documentation submitted by Chattanooga-Hamilton County did not demonstrate a clear causal relationship between the measured concentration and the event, and did not demonstrate that there would have been no exceedance or violation but for the event. Therefore, EPA concurrence was not given to any of the values flagged during this event.

Fireworks Display Permits:
July 4, 2006

State of Tennessee

CHATTANOOGA GOLF & COUNTRY CLUB
P.O. BOX 4049
CHATTANOOGA, TN 37405

FIREWORKS DISPLAY PERMIT

Having complied with the safety measures, as set out in Tennessee Code Annotated, Title 68, Chapter 22 and applicable rules and regulations governing the sale, storage and use of fireworks and having paid the required fee, the holder Tony Lamacchia of CHATTANOOGA GOLF & COUNTRY CLUB is hereby granted a permit to engage in the DISPLAY OF FIREWORKS as a PERMIT HOLDER at Chattanooga Golf & Country Club for the following date(s):

July 4, 2006

35 065501
-85.230638

The permit is issued subject to any valid private act or municipal ordinance which prohibits or restricts the sale or use of fireworks.

IN WITNESS WHEREOF, I have hereunto set
my hand caused the seal of my office to be
affixed at the City of Nashville, Tennessee
this 30th day of June, 2006.

Paula A. Havers
COMMISSIONER

IN THE PROBATE COURT OF Catoosa COUNTY

FIREWORKS DISPLAY PERMIT

APPLICANT: Talley Green/Lake Winnepesaukee
1730 Lakeview Drive
Rossville, GA 30741
TELEPHONE: 706-866-5681
FAX: 706-858-0497

Your request is hereby approved for the above applicant to conduct a Fireworks Display.

The display will be of such character as will not be hazardous to person or property.

SPONSOR: Lake Winnepesaukee

DATE OF DISPLAY: July 6, 2006 (rain date July 6, 2006)

TIME: 10:00 p.m.

LOCATION OF DISPLAY: Lake Winnepesaukee
1730 Lakeview Drive
Rossville, GA 30741

The display will be conducted by Pyrotechnico

Permission has been granted for Thomas Ruff to conduct a fireworks display in accordance with the above. (This permit is Non-Transferable.)

Judge of the Probate Court

Newspaper Articles Documenting Signal Mountain Wildfire: March 24 – 29, 2007

Firefighters battle 4-day blaze

Foresters are 'busting it' to contain Signal Mountain wildfire

By LAUREN GREGORY

Staff Writer

Members of an exhausted team of local foresters said they are grateful to receive help today from Tennessee and federal outfits as they work to quench a wildfire estimated to have spread over more than 300 acres on Signal Mountain since Friday night.

"We've got some pretty tired some pretty tired puppets," said Jim Lane of the Tennessee Department of Agriculture's Division of Forestry, who was supervising a Hixson-based crew of 24 he said had just finished fighting a fire in the North Chickamauga Creek area last week when they were called to this fire.

"These guys have been busting it for four or five days," Mr. Lane said Monday, estimating the effort would continue "at least a couple more days, if everything goes well."

The fire had not required any evacuations as of Monday and had resulted in just one injury, minor burns on a forester from McMinn County, officials said. "It's jumped across to the mountain side of Middle Creek on Sunday, threatening a residential area in which the retirement community Alexian

A P-3 airplane from Knoxville drops the second part of a 2,550 gallon load of fire retardant on an area near Alexian Village on Signal Mountain after a forest fire threatened homes in the area Monday.

BY THE NUMBERS

- 310 — acres in estimated burn area
- 24 — members of the Hixson-based state forestry crew fighting the blaze
- 20 — members of the USDA Forest Service unit sent to assist
- 6 — members of the state forestry crew from Greeneville, Tenn., sent to assist
- \$5,000 — estimated cost for one aerial chemical retardant drop

Village is situated. However, forestry officials said firefighters managed to control that outbreak.

They were working Monday to ensure the rest of the area across the creek was not at risk, according to Robert Rhinehart, assistant district forester for Southeast Tennessee.

A 20-person USDA Forest Service unit and a six-person unit from the Tennessee Forestry Division office in Greeneville, Tenn., were called in to help on the "tremendously difficult terrain" and will extend their efforts into today, Mr. Rhinehart said. The Walden's Ridge terrain contains a rock face, is extremely steep and is difficult for firefighters to get to on foot.

CONTAINING THE BLAZE

Manpower has been in great demand since the fire — which may have originated with a campfire on Edwards Point — was sparked Friday, according to Mr. Lane.

"We've got resources from all over Southeast Tennessee, and we really don't have enough people," he said, explaining that foresters and support personnel from surrounding counties have had to concentrate on preventing a spread across Middle Creek while the fire also is moving into the Suck Creek area.

The Suck Creek portion of the fire, which is not as close to residential areas, has had to go "on the back burner" to prevent

the fire from crossing Middle Creek, Mr. Lane said.

"Once we get this east flank taken care of, we can deal with that," he said.

Efforts on Monday included

WARM AND WINDY

After a record-breaking 88 degrees on Sunday, temperatures had reached 83 degrees by Monday afternoon, just shy of an 84-degree record set in 1991, said Mary Black, a meteorologist with the National Weather Service in Morristown, Tenn.

The mercury is expected to reach the lower 80s today, Ms. Black said, with just a 20 percent chance of scattered showers and thunderstorms predicted for the late afternoon. South winds are expected to blow between 10 and 15 mph, which she said is slightly above the normal five to seven mph in the area.

Without enough rain, said Amber McCorvie, spokeswoman for the Chattanooga-Hamilton County Air Pollution Control Bureau, air quality problems reported Monday likely will not clear today.

"It doesn't look like we're going to be able to get any relief anytime soon," Ms. McCorvie said. "Rain would help, but it would have to be a pretty significant rain."

The Air Pollution Control Bureau issued a "code red" health notice Monday afternoon, indicating air quality was "in the unhealthy range for the general population" because of increased levels of particulate matter. The alert was reduced to a "code orange" for today, meaning that air quality still is unhealthy for sensitive groups including people with heart or lung disease, older adults and children.

Officials advise at-risk residents to stay indoors or reduce prolonged or heavy exertion. The bureau will ask the U.S. Environmental Protection Agency to attribute Monday's air quality readings to "an unusual and exceptional event," which prevents the readings from factoring into the region's attainment status for particulate matter, officials said.

CODE ORANGE

Air quality was "unhealthy" in Chattanooga on Monday, and officials have declared a "Code Orange" alert for today. On "Code Orange" days, 50 percent of the population could be at risk, but members of the following groups may experience more serious health effects:

- Children who are active outdoors
- Adults exercising or working outdoors
- People with asthma or other respiratory conditions
- People with unusual susceptibility to air pollution

You can reduce your exposure to pollution by:

- Planning strenuous activity when pollution levels are forecast to be lower
- Reducing time spent at vigorous activity
- Choosing a less strenuous activity (going for a walk instead of a jog)

Wildfires' smoke clouds area skyline

BY MIKE O'NEAL
STAFF WRITER

The sight and smell of smoke continued to mar the skies above Walden's Ridge on Saturday, the result of a third day of wildfires.

No sooner had firefighters contained a blaze on the slopes of the North Chickamauga Creek Gorge than fire flared near Edwards Point, according to Tom Hudlow, district forester with the Tennessee Division of Forestry.

"Crews reported there was no smoke; it's under control," Mr. Hudlow said concerning the fire that burned the north-facing slope of bluffs along North Chickamauga Creek.

Foresters believe an arsonist on Thursday evening set the fire that burned 150 to 200 acres from the Blue Hole area near Soddy-Daisy upstream to a point below Boston Branch. As many as 19 firefighters were involved in containing that wildfire, Mr. Hudlow said.

A careless smoker caused a fire Saturday on the slopes and atop bluffs in Prentice Cooper State Forest, said Hamilton County Emergency Services spokeswoman Amy Maxwell.

Dry conditions and an ample supply of fuel helped the new fire spread faster than crews using rakes could clear combustible material from its path. Firefighters could be heard using radios to call for four-wheelers and leaf blowers to blast fire breaks ahead of the spreading flames.

In addition to the fires along Walden's Ridge, a forestry service bulldozer was dispatched to assist in containing a small wildfire near Sequoyah Road in

northern Hamilton County, officials said.

The potential for wildfire increases as drought continues across the tri-state region, and meteorologists say chances of significant rainfall are slight for about a week.

Even so, no fires in the "100-acre range" had been reported Saturday in Northwest Georgia, according to communications dispatchers for the Georgia Forestry Commission.

But that was not the case in nearby counties of Alabama.

"One is burning near Low Gap Mountain near Stevenson," said Linda Reaves, radio operator for the Alabama Forestry Commission.

The fire near Stevenson burned about 1,000 acres, and a fire in Cherokee County, Ala., charred about 500 acres this weekend, Ms. Reaves said. In addition, she said an arsonist had been seen setting a series of fires along county roads 91 and 93 in the Hog Jaw Valley/Bryant area.

"We are working long hours, and there doesn't seem to be any relief in sight," Ms. Reaves said.

Crews monitor 'contained' wildfire

B4 • Thursday, March 29, 2007 • •

BY BEVERLY A. CARROLL

STAFF WRITER

Forestry crews spent Wednesday walking the firebreaks around the site of a wildfire on Walden's Ridge that burned for five days and charred more than 500 acres of woody, mountainous terrain.

"We still have some of our folks up there, and we have the six-person crew from Greeneville, Tenn., up there," said Robert Rhinehart, assistant forester for the Southeast Tennessee district office. "Crews are also watching it from the air."

Nearly 50 people manned state and federal forestry crews to fight a fire that officials believe started Friday at Edwards Point, a scenic overlook on Walden's Ridge. Lack of rain aggravated efforts to contain the fire and contributed to its spread to Suck Creek Mountain, forestry officials said.

The Tennessee Army National Guard sent a helicopter to

drop water, and an air tanker dropped two separate 2,550-gallon loads of a chemical retardant on the area, officials said.

The fire was declared contained Tuesday but is not extinguished, Mr. Rhinehart said.

Robert Rhinehart

"When we leave the fire, we'll call it out," he said. "I'm not sure when that will be, but I know (crews) will look at it from the air for a few days since we haven't gotten any rain."

Mr. Rhinehart said people may see smoke or hot spots in the area and think the fire still is a threat. But those spots usually are behind fire breaks, or ditches where crews have cleared or burned combustible materials, he said.

"When the main fire gets

there, it doesn't have any place to go but out," he said. "In a fire (this size) we are only concerned about the perimeter. What people see is interior burns."

Mr. Rhinehart said officials do not want to fight those areas and "put our personnel at risk."

Derek Osborne, crew boss of a team from Oregon, said foresters go back around the perimeter once the line is established.

"We mop up afterward, making sure there isn't anything else that could be lit up," said Mr. Osborne, whose crew joined the effort Tuesday.

At one point the fire crossed Middle Creek and came near the Alexian Village retirement community in the town of Signal Mountain. Crews doused that fire, forestry officials said.

They said no one was evacuated, and only one minor injury was reported.
