Directions for Use

It is a violation of federal law to use this product in a manner inconsistent with its labeling

DO apply in the late winter-early spring to prevent crabgrass. Apply before March in Southern California, mid-March in Northern California. In all other states, apply in early spring up to time dandelions have reached puffball stage. Apply at Scotts Spreader (Standard, Automatic or Precision Flow Control Model) setting X (covers X,XXX sq ft)

DO apply when foliage is moist or dry but it should not be so tall as to touch the bottom of the spreader.

DO slightly overlap spreader wheel tracks for complete coverage.

DO sprinkle lightly after application on dichondra lawns to rinse particles off leaves.

DO use Scotts Halts® crabgrass preventer to control *barnyardgrass, foxtail, goosegrass, ragweed, lambsquarters, pigweed, knotweed* or *sheepbordpurse*.

DON'T rake or mow after applications for a period of four growing months to avoid disturbing the Turf Builder plus Halts barrier on the soil surface (rain, snow or freezing weather does not affect results.)

DON'T use on newly seeded or sodded areas until after the second mowing. Not delay a necessary or newly seeded dichondra. On newly sprigged areas, wait until the grass has filled in.

DON'T use this product to control crabgrass and other wild grasses which are already up and growing. Scotts Summer Crabgrass Control is recommended to control actively growing crabgrass.

DON'T apply more frequently than twice yearly. Do allow at least a four month interval between applications.
