Seal up the openings in the Coggshall St. Bridge - except for one. Run a canal or large diameter pipe from either Tarkiln Hill Rd. or the Wood St Bridge. The seal at the Coggshall St Bridge seals off the Lower Harbor from the Upper Harbor. Now use the area in the Upper harbor as a dump for the sludge dredged from the lower harbor. The PCB contamination is now in one place & no place to go.

Now use the upper harbor to house the Semass generating plant & the resulting ash or refuse to be spread over the sludge from the lower harbor. Deep enough with time to keep it from effecting anyone.

You see, by using the ash to cover the sludge in the upper harbor there would be no need to dump it on Crapo Hill. Thereby contaminating the ground water of Freetown & Dartmouth.

This area could be used to take all the rubbish, burnt or otherwise for sometime to come.

Covered in time by clean fill, this area could be used for various things - Park, Sport Complex - manufacturing, etc.
