MRID No. 424088-02

#### DATA EVALUATION RECORD

- 1. CHEMICAL: Diphacinone.
  - Shaughnessey No. 067701.
- TEST MATERIAL: Diphacinone technical; Batch No. T-988; 2. 96.9% active ingredient; a yellow powder.
- **STUDY TYPE:** 71-2. Avian dietary LC<sub>50</sub> test. Species 3. Tested: Mallard duck (Anas platyrhynchos).
- CITATION: Long R.D., J. Foster, K.A. Hoxter, G.J. Smith, and S.M. Campbell. 1992. Diphacinone Technical: A Dietary LC<sub>50</sub> Study with the Mallard. Project No. 284-102B. Conducted by Wildlife International, Ltd., Easton, MD. Submitted by Bell Laboratories, Inc., Madison, WI. EPA MRID No. 424088-02.
- REVIEWED BY:

Charles G. Nace Jr., M.S. Associate Scientist KBN Engineering and Applied Sciences, Inc.

APPROVED BY:

Michael L. Whitten, M.S. Wildlife Toxicologist KBN Engineering and Applied Sciences, Inc.

James J. Goodyear, Ph.D. Project Officer, EEB/EFED USEPA

Date: 2/7/94 Victory 15-94

Date: 2/7/94

signature: Jumes Boodyen

Date: 9 15 9k

- **CONCLUSIONS:** This study is scientifically sound and 7. fulfills the requirements for a dietary LC50 study using mallard ducks (Anas platyrhynchos). Based on nominal concentrations, the LC<sub>50</sub> was 906 ppm with 95% confidence limits of 187 and 35107 ppm, which classifies Diphacinone technical as moderately toxic to the mallard duck. The noobserved-effect concentration (NOEC) was not established due to overt signs of toxicity at 1.6 ppm, the lowest concentration tested.
- RECOMMENDATIONS: N/A.
- BACKGROUND:

### 10. DISCUSSION OF INDIVIDUAL TESTS: N/A.

#### 11. MATERIALS AND METHODS:

- A. <u>Test Animals</u>: The birds used in the study were 10-day old mallard ducklings (Anas platyrhynchos) obtained from a commercial supplier in Hanover, IL. All of the birds were from the same hatch, pen-reared, and phenotypically indistinguishable from wild birds. The birds could not be differentiated by sex. The birds were acclimated to the caging and test facilities from the day of receipt and appeared to be in good health at test initiation.
- B. Test System: The birds were housed indoors in pens constructed of vinyl coated wire mesh (62 x 92 x 25.5 cm). A photoperiod of 16 hours of daylight and 8 hours of darkness was maintained with fluorescent lights at an intensity of 130 lux. The average brooder temperature was maintained at 33 ±2°C, average ambient temperature was 24 ±1°C, and relative humidity averaged 65 ±13%.
- C. <u>Dosage</u>: Twenty-five day dietary LC<sub>50</sub> test. Based upon known toxicity data, six nominal concentrations of 1.6, 8, 40, 200, 1000, and 5000 parts per million (ppm) were selected for the test. Test concentrations were not adjusted for purity of the test material.
- Design: Groups of ten birds were assigned by indiscriminate draw, without regard to sex, to each of six treatment groups and three control groups. All birds were fed a game bird ration formulated to inhouse standards. Food and water were supplied ad libitum throughout the test.

The test diets were prepared by dissolving the test material in acetone and mixing the resulting solution into the diet with corn oil. The concentration of corn oil in the treated and control diets was 2%. The diets were prepared on the day of test initiation. The birds were fed the appropriate diet for 5 days (exposure period) and untreated food for 20 days (post-exposure period).

Samples of the diets were taken to verify the test concentrations administered. The samples were sent to Bell Laboratories, Madison, WI for analysis using high performance liquid chromatography (HPLC).

Mortality and symptoms of toxicity were recorded at least twice daily throughout the study. Birds were weighed by group at initiation, day 5, 8, 15, 22 and at study termination (day 25). Food consumption was recorded by group for days 0-5, 6-8, 9-15, 16-22, and 23-25.

- E. <u>Statistics</u>: Mortality data were analyzed by probit analysis using the computer program of C.E. Stephan.
- 12. REPORTED RESULTS: Measured test concentrations at 200, 1000, and 5000 ppm were 103, 115.2, and 99.8% of nominal concentrations, respectively. Test concentrations below 200 ppm (40, 8, and 1.6 ppm) were unable to be analyzed due to inseparable interference on the HPLC (Appendix III, attached).

There were no mortalities in the control groups (Table 1, attached). All birds were normal in appearance and behavior throughout the test period.

There were no mortalities at the 1.6 ppm test concentration. There was 20% mortality at 8 ppm, 30% at 40 ppm, 40% mortality at 200 ppm, 50% mortality at 1000 ppm, and 60% mortality at 5000 ppm. All mortalities were considered to be treatment-related and the observed mortality pattern was dose responsive.

There were overt signs of toxicity at all levels tested. These signs included lower limb weakness, depression, reduced reaction to external stimuli, loss of coordination, prostrate posture, convulsions, ruffled appearance, swollen legs, lethargy, wing droop, and the loss of righting reflex.

Sufficient birds to characterize the nature of the lesions associated with the mortalities were necropsied. Findings were consistent with anticoagulant ingestion, and included subcutaneous and/or internal hemorrhages.

When compared with the control groups, during the exposure period there was a reduction in body weight gain at concentrations of 40, 200, and 1000 ppm and a marked reduction in body weight gain at 5000 ppm (Table 3, attached). A reduction in body weight gain continued to be observed at 200 and 1000 ppm through day 8, and at 5000 ppm through day 15. A loss of body weight was noted at 40 and 5000 ppm from day 22 to 25 while a slight reduction in body weight gain was noted at 1.6 ppm during the same time period. Feed consumption appeared to be reduced at 5000 ppm through day 15 (Table 4, attached).

13. STUDY AUTHOR'S CONCLUSIONS/QUALITY ASSURANCE MEASURES:
"The dietary LC50 value for mallards exposed to Diphacinone Technical was determined to be 906 ppm, with a 95% confidence interval of 187 to 35107 ppm. The slope of the dose response curve was 0.5. The no-mortality level was 1.6 ppm. The no-observed-effect level was less than 1.6 ppm, the lowest concentration tested, based upon overt signs of toxicity."

The report stated that the study was conducted in conformance with Good Laboratory Practice (GLP) regulations (40 CFR Part 160). Quality assurance audits were conducted during the study and the final report was signed by a Quality Assurance Officer for Wildlife International, Ltd. An additional statement of conformance with GLP (40 CFR part 160) guidelines was included in the analytical report.

### 14. REVIEWER'S DISCUSSION AND INTERPRETATION OF STUDY RESULTS:

A. <u>Test Procedure:</u> This study followed procedures outlined in the SEP, ASTM, and Subdivision E Guidelines, except for the following deviations:

Body weights were measured by group. Individual body weights should have been measured.

The birds were not randomly assigned to pens. Instead, they were assigned by indiscriminate draw.

Diet samples were not analyzed to determine the homogeneity of the test substance in the diet.

- B. <u>Statistical Analysis</u>: The reviewer used the probit method in EPA's Toxanal program to verify the authors' LC<sub>50</sub>. The reviewer agrees with authors' LC<sub>50</sub> of 906 ppm (see attached sheet).
- C. <u>Discussion/Results</u>: The study is scientifically sound and fulfills the requirements for a dietary LC<sub>50</sub> study using mallard ducks. With an LC<sub>50</sub> of 906 ppm (nominal concentration), the test material is classified as moderately toxic to mallard ducks. The NOEC was not established due to overt signs of toxicity at 1.6 ppm, the lowest concentration tested.

# D. Adequacy of the Study:

- (1) Classification: Core.
- (2) Rationale: N/A.

# MRID No. 424088-02

- (3) Repairability: N/A.
- 15. COMPLETION OF ONE-LINER: Yes; 01/18/94.
