**Procedure (Deviation From §81-6):** The test substance was cut into circles (20-22 mm prior to application. The circles are not required to be moistened, as they are pre-moistened..

**Procedure:** The test sites on four animals was prepared by clipping. The wipres were cut into 20-22 mm circles and applied as received to each animal using an occlusive 25 mm Hill top Chamber. After six hours the chambers were removed and wiped with water and a clean towel. Approximately 24 hours after application, each site was evaluated for local reactions.

In the Induction Phase the above procedure was performed on the test animals and they were observed after 24 and 48 hours for reactions to exposure. In the Challenge Phase, 28 days after the first induction dose, a 20-22 mm circle of test substance was applied to a naive site of each animal using the procedures, above. These sites were evaluated.

**Results:** The test substance was determined to be a non-sensitizer.
