**CITATION:** Schwab, Dave, L. Brian and J. Veltri. 1996. Evaluating the Effects of Propazine on the Emergence and Vegetative Vigor of Non-Target Terrestrial Plants. Performed by ABC Laboratories, Columbia, MO. Laboratory study number 41961. Sponsored by Griffin Corporation, Valdosta, GA. Study completed on June 14, 1996.

**DISCLAIMER:** This document provides guidance for EPA and PMRA reviewers on how to complete a data evaluation record after reviewing a scientific study concerning the acute toxicity of a pesticide to terrestrial vascular plants. It is not intended to prescribe conditions to any external party for conducting this study nor to establish absolute criteria regarding the assessment of whether the study is scientifically sound and whether the study satisfies any applicable data requirements. Reviewers are expected to review and to determine for each study, on a case-by-case basis, whether it is scientifically sound and provides sufficient information to satisfy applicable data requirements. Studies that fail to meet any of the conditions may be accepted, if appropriate; similarly, studies that meet all of the conditions may be rejected, if appropriate. In sum, the reviewer is to take into account the totality of factors related to the test methodology and results in determining the acceptability of the study.

# Data Evaluation Report on the Acute Toxicity of Propazine to Terrestrial Vascular Plants: Vegetative Vigor

PMRA Submission Number {.....}

EPA MRID Number 441848-04

## EXECUTIVE SUMMARY:

The effects of Propazine Technical on vegetative vigor of monocot (onion, *Allium cepa*; oat, *Avena sativa*; ryegrass, *Lolium perenne*, corn, *Zea mays* and wheat, *Triticum aestivum*) and dicot (cabbage, *Brassica oleracea*, cucumber, *Cucumis sativus*, lettuce, *Lactuca sativa*, radish, *Raphanus sativus*, soybean, *Glycine max* and tomato, *Lycopersicon esculentum*) crops were studied at varying concentrations. The first test was conducted with all species with the exception of wheat. The second test was conducted with cabbage, soybean, tomato and wheat and the third test was conducted with oat. The nominal application rates for corn, cucumber, lettuce, onion, radish and ryegrass were 0 (negative and vehicle controls), 0.075, 0.15, 0.30, 0.60, 1.2 and 2.4 lbs ai/A; measured application rates were 0 (negative and vehicle controls), 0.075, 0.15, 0.31, 0.62, 1.2 and 2.5 lbs ai/A, respectively. The nominal application rates for cabbage and tomato were 0 (negative and vehicle controls), 0.0094, 0.019, 0.038, 0.075, 0.15 and 0.30 lbs ai/A; measured application rates were 0 (negative and vehicle controls), 0.011, 0.020, 0.038, 0.077, 0.15 and 0.33 lbs ai/A, respectively. The nominal application rates for wheat were 0 (negative and vehicle controls), 0.0094, 0.019, 0.038, 0.075, 0.15, 0.30 and 0.60 lbs ai/A; measured application rates were 0 (negative and vehicle controls), 0.011, 0.020, 0.038, 0.080, 0.15, 0.33 and 0.68 lbs ai/A, respectively. The nominal application rates for soybean were 0 (negative and vehicle controls), 0.019, 0.038, 0.075, 0.15, 0.30 and 0.60 lbs ai/A; measured application rates were 0 (negative and vehicle controls), 0.020, 0.038, 0.077, 0.15, 0.33 and 0.68 lbs ai/A, respectively. The nominal application rates for oat were 0 (negative and vehicle controls), 0.0023, 0.0047, 0.0094, 0.019, 0.038, 0.075, 0.15, 0.30, 0.60, 1.2 and 2.4 lbs ai/A; measured application rates were 0 (negative and vehicle controls), 0.0022, 0.0047, 0.010, 0.018, 0.036, 0.071, 0.14, 0.29, 0.61, 1.2 and 1.7 lbs ai/A, respectively. The growth medium used in the first vegetative vigor test was a loam soil composed of 39% sand, 43% silt and 18% clay. The pH was measured to be 7.0 and the organic matter content was determined to be 1.5%. The growth medium used for the second and third vegetative vigor tests was a loam soil composed of 32% sand, 48% silt and 20% clay. The pH was measured to be 5.8 and the organic matter content was determined to be 2.7%. On day 21, the surviving plants per pot were recorded and cut at soil level for measuring the plant height and dry weight. On day 21 or 22, the surviving plants per pot were recorded and cut at soil level for measuring the shoot weight and shoot length.

In the vegetative vigor test, the shoot weight and shoot height of all species, with the exception of corn, were affected by Propazine treatment. The most sensitive monocot species in the vegetative vigor test was wheat shoot weight with an EC<sub>25</sub> of 0.046 lbs ai/A. The most sensitive dicot species was cucumber shoot weight with an EC<sub>25</sub> of 0.10 lbs ai/A.

Wheat was the most sensitive species with slight effects in the negative and vehicle controls as nominal 0.0094-0.075 lbs ai/A treatment groups and severe effects in the nominal 0.15-0.60 lbs ai/A treatment groups. Tomato and soybean were the two species which were least affected with only slight effects (1-39) being observed for both species. All other species exhibited slight (1-39), moderate (40-69) and severe (70-100) effects. Symptoms which were most frequently observed were chlorosis, stunting, necrosis and mortalities. The effects of chlorosis were associated with shoot weight being a more sensitive indicator of toxicity.

**Maximum Labeled Rate:** Not reported

## Results Synopsis

	<b>Vegetative Vigor Value:</b>	<b>95% C.I.</b>
<u>Monocot:</u>		
Most sensitive monocot:	Wheat	
Most sensitive parameter:	Shoot Weight	
EC <sub>50</sub> /IC <sub>50</sub> :	0.070 lbs ai/A	0.056-0.088 lbs ai/A
EC <sub>25</sub> /IC <sub>25</sub> :	0.046 lbs ai/A	0.033-0.064 lbs ai/A
EC <sub>05</sub> /IC <sub>05</sub> :	0.025 lbs ai/A	0.015-0.041 lbs ai/A
NOAEC:	0.020 lbs ai/A	
Probit slope:	3.67±0.542	

# Data Evaluation Report on the Acute Toxicity of Propazine to Terrestrial Vascular Plants: Vegetative Vigor

PMRA Submission Number {.....}

EPA MRID Number 441848-04

**Dicot:**

Most sensitive dicot: Cucumber

Most sensitive parameter: Shoot Weight

EC <sub>50</sub> /IC <sub>50</sub> :	0.18 lbs ai/A	0.11-0.28 lbs ai/A
EC <sub>25</sub> /IC <sub>25</sub> :	0.10 lbs ai/A	0.052-0.20 lbs ai/A
EC <sub>05</sub> /IC <sub>05</sub> :	0.047 lbs ai/A	0.017-0.13 lbs ai/A
NOAEC:	<0.075 lbs ai/A	
Probit slope:	2.86±0.640	

This toxicity study is classified as [enter acceptability classification, e.g., acceptable/unacceptable/supplementary) and satisfies/does not satisfy the guideline requirement for a Tier II vegetative vigor toxicity study.

**Table 1. Endpoint summary by species, in (lbs ai/A)**

Species	Endpoint	NOAEC	EC <sub>05</sub>	EC <sub>25</sub>	EC <sub>50</sub>
Corn	None	2.5	>2.5	>2.5	>2.5
Oat	Shoot Weight	0.0022	0.059	0.11	0.17
Onion	Shoot Weight	0.075	0.039	0.096	0.18
Ryegrass	Shoot Weight	0.075	0.061	0.17	0.36
Wheat	Shoot Weight	0.020	0.025	0.046	0.070
Cabbage	Shoot Weight	0.011	0.076	0.13	0.19
Cucumber	Shoot Weight	<0.075	0.047	0.10	0.18
Lettuce	Shoot Weight	0.075	0.065	0.10	0.14
Radish	Shoot Weight	0.075	0.12	0.22	0.33
Soybean	Shoot Weight	0.038	0.12	0.66	2.2
Tomato	Shoot Weight	0.038	0.10	0.15	0.20

**I. MATERIALS AND METHODS**

**GUIDELINE FOLLOWED:** Study procedures followed guidelines outlined in U.S. EPA Subdivision J: 123-1 guidelines for seedling emergence and vegetative vigor tests. Deviations from these guidelines included:

1. The maximum label rate of the test material was not reported.
2. A description of the test material was not provided and the physical/chemical properties were not reported.
3. Prior treatment/sterilization and storage of seeds were not reported, the method/depth of seeding was not reported, and the age of the seedlings at the time of test material application was not reported.
4. A NOAEC value was not determined for cucumber shoot weight, however, an EC<sub>05</sub> value (with 95% C.I.) was determined.
5. The geographic location, depth of collection, and moisture content of the test soil were not reported.

These deviations did not affect the validity of the study.

**COMPLIANCE:** This study was conducted in compliance with Good Laboratory Standards

# Data Evaluation Report on the Acute Toxicity of Propazine to Terrestrial Vascular Plants: Vegetative Vigor

PMRA Submission Number {.....}

EPA MRID Number 441848-04

as published by the U.S. EPA, 40 CFR Part 160. Signed and dated GLP, Quality Assurance and No Data Confidentiality statements were provided.

## A. MATERIALS:

**1. Test Material** Propazine Technical

**Description:** Not reported

**Lot No./Batch No. :** 309027 (lot number)

**Purity:** 98.0%

**Stability of compound under test conditions:** Measured concentrations ranged from 72-112% of nominal. (*OECD recommends chemical stability in water and light*)

**Storage conditions of test chemicals:** Test material was stored in at room temperature.

**Table 2. Physical/chemical properties of Propazine Technical.**

Parameter	Values	Comments
Water solubility at 20EC	Not reported	
Vapor pressure	Not reported	
UV absorption	Not reported	
pKa	Not reported	
Kow	Not reported	

## 2. Test organism:

**Monocotyledonous species:** Corn (*Zea mays*, Family Graminae, Pioneer 3394, Lot# C93MAA-NT), Ryegrass (*Lolium perenne*, Family Graminae, Manhattan II, Lot # K5247), Oat (*Avena sativa*, Family Graminae, Settler, Lot # K6389), Onion (*Allium cepa*, Family Amaryllidaceae, Yellow Granex, Lot # A) and Wheat (*Triticum aestivum*, Family Graminae, Butte 86, Lot # 1594; *EPA recommends four monocots in two families, including corn.*

**Dicotyledonous species:** Lettuce (*Lactuca sativa*, Family Compositae, Great Lakes 659, Lot # K1010), Cabbage (*Brassica olearcea*, Family Cruciferae, Copenhagen, Lot # K5787), Radish (*Raphanus sativus*, Family Cruciferae, Crimson Giant, Lot # K1041), Soybean (*Glycine max*, Family Leguminosae, Williams 82, Lot # 4S-26-09), Cucumber (*Beta vulgaris*, Family Cucurbitaceae, Straight Eight, Lot # K1002) and Tomato (*Lycopersicon esculentum*, Family Solanaceae, Beefsteak, Lot # K1067); *EPA recommends six dicots in four families, including soybean and a root crop.*

*OECD recommends a minimum of three species selected for testing, at least one from each of the following categories: Category 1: ryegrass, rice, oat, wheat, and sorghum; Category 2: mustard, rape, radish, turnip, and Chinese cabbage;*

# Data Evaluation Report on the Acute Toxicity of Propazine to Terrestrial Vascular Plants: Vegetative Vigor

PMRA Submission Number {.....}

EPA MRID Number 441848-04

*Category 3: vetch, mung bean, red clover, fenugreek, lettuce, and cress.*

**Seed source:** Cabbage, Cucumber, Lettuce, Oat, Ryegrass, Radish and Tomato, Royal Seed Co.; Corn, Pioneer Hi-Breed Int.; Onion, Henry Field's Seed & Nursery Co.; Soybean, Missouri Foundation Seed; Wheat, South Dakota Foundation Seeds

**Prior seed treatment/sterilization:** Not reported

**Historical % germination of seed:** 85-99%

**Seed storage, if any:** Not reported

## B. STUDY DESIGN:

### 1. Experimental Conditions

a. Limit test: N/A

b. Range-finding study: A range-finding study was not conducted; however, continuation tests with lettuce, oat, onion, tomato and wheat were conducted using lower application rates in order to determine valid NOAEC values for these species.

c. Definitive Study

**Table 3: Experimental Parameters - Vegetative Vigor**

Parameters	Vegetative Vigor	
	Details	Remarks <i>Criteria</i>
Duration of the test	21-22 Days	<i>Recommended test duration is 14-21 days.</i>
Number of seeds/plants/species/replicate	Ten plants/rep were initially planted.	<i>Five plants per replicate are recommended.</i>
Number of plants retained after thinning	After thinning, five plants/rep were retained.	
Number of replicates Control: Solvent control: Treated:	4 4 4	<i>Four replicates per dose are recommended</i>

### 2. Observations:

Table 4: Observation Parameters - Vegetative Vigor

**Data Evaluation Report on the Acute Toxicity of Propazine to Terrestrial Vascular Plants:  
Vegetative Vigor**

PMRA Submission Number {.....}

EPA MRID Number 441848-04

Parameters	Vegetative Vigor	
	Details	Remarks
Parameters measured (i.e., plant height, dry weight or other endpoints)	Shoot length, shoot weight and phytotoxicity.	
Measurement technique for each parameter	For monocots and for the dicots cabbage, lettuce and radish, shoot length was measured as the distance from the base of the stem to the tip of the longest fully extended leaf. For the remaining dicots, shoot length was measured as the distance from the base of the stem to the apical bud. All shoot lengths were measured to the nearest millimeter using a ruler. Seedling weight was determined by clipping each plant at the soil surface and weighing to the nearest hundredth's of a gram. Shoot length and shoot weight were determined 21-22 days after application (at test termination). Phytotoxicity observations were made weekly, at which point two observations were made on each replicate. The first was an overall rating, on a scale of 0-100, assessing the frequency and intensity of the effects compared to that replicate's control. The second was a symptom rating to assess the frequency and intensity of the observed effect (chlorosis, necrosis, etc).	
Observation intervals	Shoot length and shoot weight were determined 21-22 days after application (at test termination). Phytotoxic observations were made weekly.	
	None

	Details	Remarks
Other observations, if any		
Were raw data included?	Only replicate means were reported.	
Phytotoxicity rating system, if used	0, No Effect; 1-39, Slight Effect; 40-69, Moderate Effect; 70-100, Severe Effect	The source for the phytotoxicity rating scale was not provided.

## II. RESULTS and DISCUSSION:

### A. INHIBITORY EFFECTS:

#### Vegetative Vigor:

Corn was the only species in which shoot weight and shoot length were not significantly reduced when compared to the controls. All other species exhibited a significant reduction for both endpoints when compared to the controls. The most sensitive monocot and endpoint was wheat shoot weight with a NOAEC, EC<sub>25</sub> and EC<sub>50</sub> of 0.038, 0.049 and 0.070 lbs ai/A, respectively. The most sensitive dicot and endpoint was cabbage shoot weight with a NOAEC, EC<sub>25</sub> and EC<sub>50</sub> of 0.019, 0.079 and 0.15 lbs ai/A, respectively.

Wheat was the most sensitive species with slight effects in the negative and vehicle controls as nominal 0.0094-0.075 lbs ai/A treatment groups and severe effects in the nominal 0.15-0.60 lbs ai/A treatment groups. Tomato and soybean were the two species which were least affected with only slight effects (1-39) being observed for both species. All other species exhibited slight (1-39), moderate (40-69) and severe (70-100) effects. Symptoms which were most frequently observed were chlorosis, stunting, necrosis and mortalities. The effects of chlorosis were associated with shoot weight being a more sensitive indicator of toxicity.

# Data Evaluation Report on the Acute Toxicity of Propazine to Terrestrial Vascular Plants: Vegetative Vigor

PMRA Submission Number {.....}

EPA MRID Number 441848-04

## B. REPORTED STATISTICS:

The reviewer had no objections to the study author's statistical analyses. Pages 24 and 25 of the study report are appended to this DER.

## C. VERIFICATION OF STATISTICAL RESULTS BY THE REVIEWER:

Any species exhibiting a  $\geq 5\%$  reduction in shoot weight or shoot length when compared to the control was statistically analyzed for significance. All analyzed data were tested for normality and homogeneity and if these assumptions of ANOVA were met, the NOAEC values were determined using Dunnett's Test or Bonferoni's Test (parametric) and William's Test or Kruskal-Wallis Test (non-parametric) via Toxstat Statistical Software. The ECx values (with 95% C.I.) and probit slopes were determined using Nuthatch Statistical Software. The EC<sub>25</sub> and EC<sub>50</sub> values were determined visually when the % reduction, compared to the control, was  $< 25\%$  or  $< 50\%$ , respectively. All analyses were conducted using the mean-measured treatment concentrations. Replicates with 100% mortality were excluded from the analyses for shoot length and shoot weight. Phytotoxicity was not statistically analyzed as this endpoint is a qualitative value. The negative and vehicle controls were compared using a T-test via Microsoft Excel and results are reported in the Reviewer's Comments Section of this DER. However, if no differences existed between the two controls, a pooled control was not used in the analysis of the treatment data. When ECx values were greater than the highest application rate, the extrapolated value was not reported. Due to the non-linear responses of several species and endpoints, the reviewer visually determined a more conservative NOAEC value based on the percent reduction when compared to the control instead of the value determined in the analyses. See the Reviewer's Comments section for further detail.

## D. STUDY DEFICIENCIES:

There were no study deficiencies.

## E. REVIEWER'S COMMENTS:

## Data Evaluation Report on the Acute Toxicity of Propazine to Terrestrial Vascular Plants: Vegetative Vigor

PMRA Submission Number {.....}

EPA MRID Number 441848-04

The reviewer's statistical output are reported in the Executive Summary and Conclusions sections of this DER because they are based on mean-measured concentrations and include EC<sub>05</sub> values and probit slopes; the study author's toxicity values were based on nominal concentrations and did not include EC<sub>05</sub> values or probit slopes.

In the analyses for shoot weight, all NOAEC values were determined visually based on percent reduction when compared to the control group with the exception of corn, lettuce, soybean and tomato. These NOAEC values were determined visually because the percent reduction at the respective treatment levels was <10% and the reductions at the higher treatment levels was ≥10%. A NOAEC value was not determined for cucumber shoot weight, however, an EC<sub>05</sub> value (with 95% C.I.) was determined. The NOAEC value for wheat shoot weight (0.020 lbs ai/A) was determined visually based on the 6% reduction when compared to the negative control. There was a 17% reduction in the lowest treatment group (mean-measured 0.011 lbs ai/A), however, the reviewer did not feel that this reduction was significant based on the apparent dose-dependent response in the remaining treatment groups. The NOAEC values for soybean and tomato shoot weight were determined by looking at the percent reductions when compared to the negative controls for both the original and continuation study. In the initial study with soybean (0.075 to 2.5 lbs ai/A), there was a 16% reduction in the lowest mean-measured treatment group (0.075 lbs ai/A). In the continuation study with soybean (0.020 to 0.68 lbs ai/A), percent reduction ranged from -1 to 27% in the mean-measured treatment groups (0.020-0.68 lbs ai/A). Therefore, the reviewer determined the NOAEC value to be 0.038 lbs ai/A (7% reduction in the continuation study when compared to the negative control); the highest level tested in the continuation study that was below the lowest level of the original study (0.075 lbs a./A, which exhibited a 16% reduction when compared to the negative control). For soybean, only raw data from the continuation study were provided, therefore, the reviewer used those values in determining the EC<sub>x</sub> values. In the initial study with tomato (0.075 to 2.5 lbs ai/A), there was an 11% reduction in the lowest mean-measured treatment group (0.075 lbs ai/A). In the continuation study with tomato (0.011 to 0.33 lbs ai/A), percent reduction ranged from -6 to 10% in the mean-measured treatment groups (0.011-0.33 lbs ai/A). Therefore, the reviewer determined that the NOAEC value to be 0.038 lbs ai/A (-6% reduction in the continuation study when compared to the negative control); the highest level tested in the continuation study that was below the lowest level of the original study (0.075 lbs a./A, which exhibited an 11% reduction when compared to the negative control). The EC<sub>x</sub> values were determined using the data set from the original study as it yielded more conservative toxicity values and 95% confidence intervals.

In the analyses for shoot length, all NOAEC values were determined visually based on percent reduction when compared to the control group with the exception of corn, ryegrass, wheat and lettuce. These NOAEC values were determined visually because the percent reduction at the respective treatment levels was <10% and the reductions at the higher treatment levels was ≥10%. The NOAEC values for soybean and tomato shoot length were determined by looking at the percent reductions when compared to the negative controls for both the original and continuation study. In the initial study with soybean (0.075 to 2.5 lbs ai/A), percent reduction was 5% in the mean-measured 0.15 lbs ai/A treatment group and ≥13% in the mean-measured 0.31-2.5 lbs ai/A treatment groups. In the continuation study with soybean (0.020 to 0.68 lbs ai/A), percent reduction ranged from -1 to 6% in all treatment groups. Therefore, the reviewer determined that the NOAEC value to be 0.15 lbs ai/A based on the fact that it was the highest treatment level in both the original and continuation study that resulted in <10% reduction in shoot length when compared to the control. For soybean, only raw data from the continuation study were provided, however, this data set was not able to produce EC<sub>x</sub> values. Therefore, the reviewer visually estimated the range for the EC<sub>x</sub> values based on the percent reductions from both the original and continuation studies. In the initial study with tomato (0.075 to 2.5 lbs ai/A), percent reduction was 10% in the lowest treatment group (mean-measured 0.075 lbs ai/A). In the continuation study with tomato (0.011 to 0.33 lbs ai/A), percent reduction ranged from 1 to 13% in all treatment groups. Therefore, the reviewer determined that the NOAEC value to be 0.038 lbs ai/A based on the fact that it was the highest treatment level in both the original and continuation study that resulted in <10% reduction in shoot length when compared to the control. The EC<sub>x</sub> values were determined using the data set from the original study as it yielded more conservative toxicity values and 95% confidence intervals.

# Data Evaluation Report on the Acute Toxicity of Propazine to Terrestrial Vascular Plants: Vegetative Vigor

PMRA Submission Number {.....}

EPA MRID Number 441848-04

The study authors gave dead plants values of 0 for shoot weight and shoot length. Therefore, replicates that experienced 100% mortality had replicate values of 0, and the replicate means in which mortality was <100% were lowered due to the 0 value for dead plants. In order to remain consistent throughout all analyses, the reviewer included dead plants in the statistical verification as there was no way to differentiate replicates that experience mortality or severe reductions due to application of Propazine Technical. The lowered replicate means most likely resulted in more conservative ECx values.

Even though pooled controls were not used in the analysis of end points, the reviewer determined whether or the negative and vehicle controls for each species and endpoint differed significantly. Cucumber shoot weight and radish shoot length were the only species and endpoints in which the negative control significantly differed from the vehicle control.

Initially, only ten species were to be tested, however, wheat was added as a protocol amendment to evaluate an additional monocot species which is typically grown as a rotational crop following propazine application in grain sorghum production. Because a satisfactory NOAEC value was not determined during the initial test, a second continuation test was conducted with cabbage, lettuce, oat and onion; wheat was added to the study design during the first continuation test. A second continuation test was conducted with even lower application rates for lettuce, oat, onion and wheat.

In the analysis of shoot weight, the study authors utilized fresh weight as opposed to dry weight, which does not take into account the variability associated with water-holding capacity. Dry weight is a preferred endpoint for analyzing biomass.

The in-life portion of the vegetative vigor test with corn, cucumber, ryegrass, radish, soybean and tomato was initiated on February 28, 1995 and continued for 21-22 days. The in-life portion of the final seedling emergence test for cabbage was initiated on May 31, 1995 and continued for 21-22 days. The in-life portion of the final seedling emergence test for lettuce, oat, onion and wheat was initiated on August 2, 1995 and continued for 21-22 days.

Propazine analytical standard (batch no. 177-19-1, CAS #139-40-2) was received from Griffin Corporation on May 23, 1994 and was stored at room temperature. The reported purity was 98.2%. Upon receipt, the standard was assigned ABC reference #PS-7296. This standard was used to prepare chromatographic reference standards for GLC.

## F. CONCLUSIONS:

Indicate if the study is acceptable/unacceptable/supplementary. The most sensitive monocot was wheat shoot weight with NOAEC, EC<sub>05</sub> and EC<sub>25</sub> values of 0.020, 0.025 and 0.046 lbs ai/A, respectively. The most sensitive dicot was cucumber shoot weight with NOAEC, EC<sub>05</sub> and EC<sub>25</sub> values of <0.075, 0.047 and 0.10 lbs ai/A, respectively.
