TOXIC SUBSTANCES

MEMORANDUM

SUBJECT: Dietary Exposure Analysis for Profenofos in Support of the Reregistration Eligibility Decision.

FROM: Brian Steinwand *BS*
Dietary Risk Evaluation Section
Science Analysis Branch/HED (7509C)

Through: Elizabeth Doyle, Section Head *E. A. Doyle*
Dietary Risk Evaluation Section *WJB*
SAB/Health Effects Division

TO: Mike Metzger, Chief
Risk Characterization Analysis Branch
Health Effects Division (7509C)

Action Requested

Provide a dietary exposure analysis to estimate the chronic and acute dietary exposure and risk from profenofos for uses which are being supported through reregistration.

Discussion

The tolerance expression should be revised to reflect profenofos *per se* as the only regulated residue as per the HED Metabolism Committee decision (See memo, C. Eiden, 11/5/95). Changes in and revocation of existing tolerances, and the addition of a new tolerance, are based on a tolerance reassessment resulting from the changes in the tolerance expression.

Toxicological Endpoint:

The Reference Dose (RfD) used in the analysis is 0.00005 mg/kg bwt/day, based on a NOEL of 0.005 mg/kg bwt/day and uncertainty factor of 100. The NOEL is based on a six month dog feeding study which demonstrated the toxic effect of plasma and red blood cell cholinesterase inhibition (See IRIS). Profenofos is classified as a Group E, negative for carcinogenicity in both rats and mice.

1
11

The endpoint for acute dietary risk assessment is the plasma cholinesterase inhibition (males) and red blood cell cholinesterase inhibition (females) NOEL of 0.5 mg/kg/day. A margin of exposure (MOE) of 10 is considered adequate (See Tox Endpoint Selection Document, 1/26/96).

Residue Information

Tolerances for profenofos are published in 40 CFR §180.404 and 186.4975. Tolerances had been established in/on cottonseed (3.0 ppm), eggs and the fat, meat, and meat byproducts of cattle, goats, hogs, horses, and sheep (0.05 ppm) and milk (0.01 ppm). The established tolerances on animal commodities are adequate but should be redefined in terms of profenofos *per se*.

CBRS recommends the revocation of tolerances for poultry commodities and a decrease in the existing tolerance for cottonseed. There are no other suggested revocations or reassessed tolerances (See memo, C. Eiden, 11/5/95). However, even with these crops included in the chronic risk analysis, and the tolerance for cottonseed remaining at the higher tolerance figure, the $\%RfD$ was not exceeded in any subgroup.

Anticipated residues were provided by CBRS (See memo, C. Olinger, 9/12/90) based on cottonseed processing and livestock feeding studies. Note that DRES evaluates all livestock commodities at 100% crop treated because the percent use on cotton (with an assumption of national distribution of food items) is factored into livestock anticipated residues.

As the annual use of profenofos on cotton varies from year to year, the percent crop treated figure used was 10 per cent. This may be an underestimation, but would be accurate for certain years (Personal communication, A. Grube, 4/29/96).

Results

A summary of the residue information included in this analysis is attached as Table 1. A DRES chronic exposure analysis was performed using tolerance level residues and 100 percent crop treated information to estimate the Theoretical Maximum Residue Contribution (TMRC), and anticipated residues to estimate the Anticipated Residue Contribution (ARC) for the general population and 22 subgroups. Summaries of the TMRCs and ARCs and their representations as percentages of the Reference Dose (RfD) are included as Tables 2 and 3. The results of the acute dietary analysis are included in Table 4.

Existing tolerances (See Table 2) result in a TMRC which represents 7.7% of the RfD for the U.S. general population, 21.0% for Non-Nursing Infants (< 1 year old) and 18.1% for children (1-6).

The chronic analysis for profenofos is not a worst case estimate of dietary exposure, and includes some residues at anticipated levels and 100 percent of the commodities assumed to be treated with profenofos. Based on the risk estimates calculated in this analysis, it appears that chronic dietary risk from the uses recommended through reregistration, is not of concern.

Acute Exposure:

The acute analysis (See Table 4) entailed all published uses of profenofos and includes those commodities which CBRS recommends to be revoked. Even with these commodities included in the acute analysis, it appears that acute dietary risk from the uses recommended through reregistration, is not of concern.

The DRES detailed acute analysis estimates the distribution of single-day exposures for the overall U.S. population and certain subgroups. The analysis evaluates individual food consumption as reported by respondents in the USDA 1977-78 Nationwide Food Consumption Survey (NFCS) and accumulates exposure to the chemical for each commodity. Each analysis assumes uniform distribution of sulprofos in the commodity supply.

The Margin of Exposure (MOE) is a measure of how close the high end exposure comes to the NOEL (the highest dose at which no effects were observed in the laboratory test), and is calculated as the ratio of the NOEL to the exposure ($NOEL/exposure = MOE$). Generally, acute dietary margins of exposure greater than 100 tend to cause no dietary concern when the data are compared to an endpoint from an animal study. The lowest MOE value of 250 (See Table 4) is above the acceptable level and demonstrates no acute dietary concern.

TABLE 3

TOLERANCE ASSESSMENT SUMMARY FOR Profenofos (Curacron)
USING ANTICIPATED RESIDUES
CASWELL #266AA

DATE: 04/29/96

ANALYSIS FOR POPULATION SUB-GROUP: U.S. POPULATION - 48 STATES

EXISTING ANTICIPATED RESIDUES (PUBLISHED ONLY)
RESULT IN AN ARC OF: 0.000004 MG/KG/DAY
THE EXISTING ARC IS EQUIVALENT TO: 7.770 % OF THE ADI.

NO NEW ANTICIPATED RESIDUES ARE IN THE FILE.

NO OTHER PENDING ANTICIPATED RESIDUES ARE IN THE FILE

ANALYSIS FOR POPULATION SUB-GROUP: NON-NURSING INFANTS (< 1 YEAR OLD)

EXISTING ANTICIPATED RESIDUES (PUBLISHED ONLY)
RESULT IN AN ARC OF: 0.000011 MG/KG/DAY
THE EXISTING ARC IS EQUIVALENT TO: 21.020 % OF THE ADI.

NO NEW ANTICIPATED RESIDUES ARE IN THE FILE.

NO OTHER PENDING ANTICIPATED RESIDUES ARE IN THE FILE
