## Executive Summary

Acute and chronic dietary (food & drinking water) exposure analyses were conducted using the Dietary Exposure Evaluation Model (DEEM-FCID™, Version 2.03) which uses food consumption data from the U.S. Department of Agriculture's Continuing Surveys of Food Intakes by Individuals (CSFII) from 1994-1996 and 1998. These analyses were performed to support Section 3 requests on barley, oat, rye, wild rice, buckwheat, pistachio, cucurbit vegetables (crop group 9), grass forage & hay (crop group 17), and tuberous & corm vegetables (crop group 1-c).

### Acute Dietary Exposure Results and Characterization

A refined acute probabilistic dietary exposure assessment was performed for lambda-cyhalothrin to support all food uses and drinking water. The acute dietary exposure assessment incorporated processing factors and percent crop treated (%CT) estimates provided by the Biological and Economic Analysis Division (BEAD). Acute anticipated residues were derived from PDP monitoring data, field trial studies, and market basket survey for beef-fat.

The Estimated Drinking Water Concentrations (EDWCs) for lambda-cyhalothrin were calculated based on a maximum application rate of 0.5 lb a.i./A/season for seed orchards (ground application) for surface concentrations. The acute drinking water concentration in surface water of 5.35 ppb was based on the FIRST (FQPA Index Reservoir Screening Tool) estimated peak concentration.

The acute dietary exposure estimates for food and drinking water are below HED's level of concern (<100% aPAD) at the 99.9<sup>th</sup> percentile of exposure. Lambda-cyhalothrin dietary exposure at the 99.9<sup>th</sup> percentile for food and drinking water is 46% of the aPAD for the U.S. population and 61% aPAD for all infants (<1yr), the most highly exposed population subgroup.

### Chronic Dietary Exposure Results and Characterization

A refined chronic dietary exposure assessment was also conducted for the supported food uses of lambda-cyhalothrin and drinking water represented by a single point estimate of anticipated residues for food and drinking water. The surface water concentration of 0.130 ppb was based on the FIRST estimated mean concentration from applications on seed orchards.

The chronic dietary exposure estimates for food and drinking water are below HED's level of concern (<100% cPAD) for the U.S. population and all population subgroups. Lambda-cyhalothrin dietary exposure for food and drinking water is 17% of the cPAD

---

for the U.S. population and 50% of the cPAD for children 1-2 yrs old, the most highly exposed population subgroup.

### Cancer Dietary Exposure Results and Characterization

Lambda-cyhalothrin is classified as “not likely to be carcinogenic to humans.” Therefore, a cancer dietary analysis is not required.

## **I. Introduction**

Dietary risk assessment incorporates both exposure and toxicity of a given pesticide. For acute and chronic assessments, the risk is expressed as a percentage of a maximum acceptable dose (i.e., the dose which HED has concluded will result in no unreasonable adverse health effects). This dose is referred to as the population adjusted dose (PAD). The PAD is equivalent to the reference dose (RfD) divided by the Food Quality Protection Act (FQPA) Safety Factor.

For acute and non-cancer chronic exposures, HED is concerned when estimated dietary risk exceeds 100% of the PAD. References which discuss the acute and chronic risk assessments in more detail are available on the EPA/pesticides web site: “Available Information on Assessing Exposure from Pesticides, A User’s Guide,” 6/21/2000, web link: <http://www.epa.gov/fedrgstr/EPA-PEST/2000/July/Day-12/6061.pdf>; or see SOP 99.6 (8/20/99).

The most recent dietary exposure analysis for lambda-cyhalothrin was performed in August of 2002 by William Cutchin when lambda-cyhalothrin was in the process of being registered for use on canola, pome fruits, stone fruits, tree nuts, imported avocados, fruiting vegetables (except cucurbits), peas and beans, dried, succulent shelled, and edible podded, and sugarcane (Aug 06 2002, D276160).

## **II. Residue Information**

Lambda-cyhalothrin is a synthetic pyrethroid insecticide/acaricide used to control a wide range of pests in/on food and feed crops, on livestock, and in and around building and structures. Tolerances are established for the combined residues of lambda-cyhalothrin and its epimer (R157836) in/on plant commodities at levels ranging from 0.01 ppm on soybeans to 10.0 ppm on dried hops and include aspirated grain fractions, head and stem *Brassica* subgroup, corn, cotton seed, dry bulb onions, lettuce, peanuts, soybeans, sorghum, sunflowers, tomatoes, and wheat [40 CFR §180.438(a)(1)]. Tolerances are also established for the combined residues of lambda-cyhalothrin and R157836 in meat, milk, poultry, and eggs (MMPE) at levels ranging from 0.01 ppm in eggs, poultry meat, and poultry meat by-products to 5.0 ppm in milk fat (reflecting 0.2 ppm in whole milk), including a 3.0 ppm tolerance for residues in fat of livestock. In addition, a tolerance of

0.01 ppm has been established for residues in foods potentially exposed to the insecticide during treatment of food handling establishments (FHE).

The revised and new tolerances are listed in Table 1, below. Table 1 does not list the established tolerances that are not being revised. Tolerances for these commodities can be found in [40 CFR §180.438(a)(1)], as stated above.

**Table 1. Lambda-Cyhalothrin: New, and Revised Tolerances**

Commodity	Recommended Tolerance (ppm)
Barley, bran	0.2
Barley, grain	0.05
Barley, hay	2.0
Barley, straw	2.0
Buckwheat, grain	0.05
Cucurbit vegetables	0.05
Grass, forage	7.0
Grass, hay	7.0
Grass, straw	10
Hog, fat	0.2
Hog, meat	0.01
Hog, meat-byproducts	0.02
Milk, fat	10
Oat, grain	0.05
Oat, forage	2.0
Oat, hay	2.0
Oat, straw	2.0
Pistachio	0.05
Rice, wild, grain	1.0
Rye, bran	0.2
Rye, grain	0.05
Rye, forage	2.0
Rye, straw	2.0
Tuberous and corm vegetables	0.02

#### Residue of Concern

The tolerances for lambda cyhalothrin are established as the combined residues of lambda cyhalothrin, a 1:1 mixture of (S)- $\alpha$ -cyano-3-phenoxybenzyl -(Z)-(1R,3R) -3-(2-chloro-3,3,3- trifluoroprop-1-enyl)-2,2- dimethylcyclopropanecarboxylate and (R)-  $\alpha$ -cyano-3- phenoxybenzyl- (Z)-(1S,3S)-3-(2-chloro-3,3,3- trifluoroprop-1-enyl) -2,2 -

---

dimethylcyclopropanecarboxylate and its epimer (R157836) expressed as epimer of lambda cyhalothrin, a 1:1 mixture of (S)- $\alpha$ -cyano-3- phenoxybenzyl- (Z)-(1S,3S)- 3- (2-chloro- 3,3,3- trifluoroprop -1-enyl)-2,2- dimethylcyclopropane- carboxylate and (R)- $\alpha$ -cyano-3- phenoxybenzyl-(Z)-(1R,3R) -3-(2-chloro- 3,3,3- trifluoroprop-1- enyl) -2,2- dimethylcyclopropanecarboxylate.

The nature of the residue in plants is adequately understood based on adequate cotton, cabbage, soybeans and wheat metabolism studies (PP#7F3560/7H5543, M. Flood, 1/22/92). Lambda-cyhalothrin is metabolized by cleavage of the ester linkage to form cyclopropanecarboxylic acids and the corresponding phenoxybenzoic acids or alcohols. In most cases the parent compound is the principal constituent of the residue. However, in the cabbage metabolism study the cis- and trans- cyclopropanecarboxylic acids were the major constituents. HED has concluded that the plant metabolites need not appear in the tolerance expression at this time due to lack of toxicological concern and low concentrations found from residue studies (Memo, P. Hurley, 1/3/92). The residue to be regulated is lambda-cyhalothrin and its epimer R157836.

Studies of lambda-cyhalothrin metabolism in ruminants and poultry have been reviewed. Lambda-cyhalothrin is the major component of the residue in animals, except in kidney and liver, where, in addition to the plant metabolites, 3-(2-chloro-3,3,3-trifluoroprop-1-enyl)-2-hydroxymethyl-2-methylcyclopropane-carboxylic acid (OH-CPA) and 4-hydroxy-3-phenoxybenzoic acid (4'-OH-3PBACid) may be present in significant quantities. A residue transfer study in which cows were fed dietary levels of 8, 25 or 80 ppm lambda-cyhalothrin demonstrated that, at < 8 ppm, OH-CPA levels in tissue would not exceed 0.01 ppm (PP#2F4109, 2F4114, 7F3560, and 1F3992, M. Flood, 8/31/92). As with plants, HED has determined that the residue to be regulated is lambda-cyhalothrin and its epimer R157836. The animal metabolites do not need to appear in the tolerance expression.

#### Residue Data Used for Acute and Chronic Dietary Assessments

The registrant supported new uses on barley, oat, rye, wild rice, buckwheat, cucurbit vegetables (crop group 9), grass forage & hay (crop group 17), tuberous & corm vegetables (crop group 1-c). New field trials were carried out on cantaloupes, cucumbers, potatoes, and summer squash. A market basket survey was provided by Syngenta for Beef-fat. Adequate PDP monitoring data are available for the following commodities: apples, broccoli, cauliflower, lettuce, onions, peaches, pears, sweet bell peppers, soybeans, wheat, sweet corn, sweet peas, and butter. Tolerance level values were used for the following commodities: okra, eggplant, poultry, treenuts group (crop group 14) except almonds & pecans, and tuberous & corm vegetables subgroup (crop group 1-c) except potatoes. Anticipated residues for lambda-cyhalothrin based on PDP monitoring data, field trial studies, and market basket survey for beef-fat are provided in Attachment 1 (table 5).

### Market Basket Survey for Beef-fat (MRID# 46686001)

A market basket survey was provided by Syngenta for beef-fat. Of the 232 samples, lambda-cyhalothrin was non-detectable (<1 ppb) in 216 samples (93.1%), detectable but non-quantifiable in 11 samples (4.7%), and quantifiable ( $\geq 3$  ppb) in only 5 samples (2.2%). Quantifiable residues of lambda-cyhalothrin were found at 3.0-19.2 ppb, and were confirmed by a secondary analysis. The results of the beef fat market basket study were translated from beef fat to all other beef commodities (i.e. meat and meat by-products).

Metabolism data have shown that lambda-cyhalothrin residues concentrate in fat, and therefore beef fat residues represent an upper-bound estimate of residues that could potentially be found in all beef commodities. Although the recommended tolerances for residues in livestock feed items could potentially contribute to secondary residues in livestock commodities, HED would not expect increased residues in beef commodities, based on the maximum theoretical dietary burden from existing and proposed uses. Furthermore, the market basket survey data reflect both secondary residues from feed items as well as residues resulting from direct dermal application to beef cattle. The market basket survey data present a realistic estimate of residues in beef fat, which are likely conservative estimates of potential residues in meat and meat by-products.

### PDP Monitoring Data Residue Estimates for Individual Crops

Apples: PDP data from 2004-2005 was used for apples. A total of 1056 samples were analyzed for lambda-cyhalothrin and R157836. The combined residues of lambda-cyhalothrin and R157836 were detected in 12 samples. The estimated maximum %CT for apples of 10% was used for the acute dietary risk assessment and the estimated average %CT of 5% was used for the chronic dietary risk assessment. The highest apple detection value was used as a point estimate for the translation to crabapple.

Broccoli: PDP data from 2002 was used for broccoli. A total of 522 samples were analyzed for lambda-cyhalothrin and R157836. The combined residues of lambda-cyhalothrin and R157836 were detected in 1 sample. The estimated maximum %CT for broccoli of 20% was used for the acute dietary risk assessment and the estimated average %CT of 10% was used for the chronic dietary risk assessment.

Cauliflower: PDP data from 2004-2005 was used for cauliflower. A total of 926 samples were analyzed for lambda-cyhalothrin and R157836. The combined residues of lambda-cyhalothrin and R157836 were not detected in any samples. The estimated maximum %CT for cauliflower of 30% was used for the acute dietary risk assessment and the estimated average %CT of 20% was used for the chronic dietary risk assessment.

---

Lettuce: PDP data from 2004-2005 was used for lettuce. A total of 1054 samples were analyzed for lambda-cyhalothrin and R157836. The combined residues of lambda-cyhalothrin and R157836 were detected in 102 samples. The estimated maximum %CT for lettuce of 45% was used for the acute dietary risk assessment and the estimated average %CT of 30% was used for the chronic dietary risk assessment.

Onions: PDP data from 2002-2003 was used for onions. A total of 1049 samples were analyzed for lambda-cyhalothrin and R157836. The combined residues of lambda-cyhalothrin and R157836 were not detected in any samples. The estimated maximum %CT for onions of 55% was used for the acute dietary risk assessment and the estimated average %CT of 50% was used for the chronic dietary risk assessment. Onions data were translated to garlic.

Peaches: PDP data from 2002 was used for peaches. A total of 563 samples were analyzed for lambda-cyhalothrin and R157836. The combined residues of lambda-cyhalothrin and R157836 were detected in 1 sample. The estimated maximum %CT for peaches of 10% was used for the acute dietary risk assessment and the estimated average %CT of 5% was used for the chronic dietary risk assessment. The peach detection value was used as a point estimate for the translations to apricot and nectarine.

Pears: PDP data from 2004-2005 was used for pears. A total of 721 samples were analyzed for lambda-cyhalothrin and R157836. The combined residues of lambda-cyhalothrin and R157836 were not detected in any samples. The estimated maximum %CT for pears of 30% was used for the acute dietary risk assessment and the estimated average %CT of 15% was used for the chronic dietary risk assessment. The pear  $\frac{1}{2}$  limit of detection (LOD) value was used as a point estimate for the translations to loquats and quinces.

Bell Peppers: PDP data from 2002 and 2004 was used for bell peppers. A total of 1485 samples were analyzed for lambda-cyhalothrin and R157836. The combined residues of lambda-cyhalothrin and R157836 were detected in 45 samples. The estimated maximum %CT for bell peppers of 15% was used for the acute dietary risk assessment and the estimated average %CT of 5% was used for the chronic dietary risk assessment.

Soybean: PDP data from 2005 was used for soybeans. A total of 368 samples were analyzed for lambda-cyhalothrin and R157836. The combined residues of lambda-cyhalothrin and R157836 were not detected in any samples. The estimated maximum %CT for soybeans of 10% was used for the acute dietary risk assessment and the estimated average %CT of 5% was used for the chronic dietary risk assessment.

Wheat: PDP data from 2005 was used for wheat. A total of 674 samples were analyzed for lambda-cyhalothrin and R157836. The combined residues of lambda-cyhalothrin and R157836 were detected in 1 sample. The estimated maximum %CT for wheat of 2.5%

---

was used for the acute dietary risk assessment and the estimated average %CT of 1% was used for the chronic dietary risk assessment. The wheat detection value was used as a point estimate for the translations to barley, oat, rye, and buckwheat.

Butter: PDP data from 2003 was used for butter. A total of 731 samples were analyzed for lambda-cyhalothrin and R157836. The combined residues of lambda-cyhalothrin and R157836 were detected in 422 samples. Estimates of maximum and average %CT for butter were not available. The acute and chronic dietary risk assessments used 100% crop treated. The PDP monitoring data for butter were translated to milk, which is considered to be a conservative approach for estimating residues in milk. Metabolism data have shown that lambda-cyhalothrin residues concentrate in fat and in milk fat; since butter has a higher fat content than milk, residues in butter are expected to be higher than residues in milk. In the absence of milk monitoring data, HED chose to use the butter monitoring data as an upper bound estimate of residues in milk; this approach was considered to be better than using anticipated residues from feeding studies, since the butter monitoring data reflect secondary residues as well as residues resulting from direct dermal application to lactating dairy cattle.

Sweet Corn, Canned/Frozen: PDP data from 2002-2003 was used for sweet corn. A total of 915 samples were analyzed for lambda-cyhalothrin and R157836. The combined residues of lambda-cyhalothrin and R157836 were not detected in any samples. The estimated maximum %CT for sweet corn of 60% was used for the acute dietary risk assessment and the estimated average %CT of 45% was used for the chronic dietary risk assessment.

Sweet Peas, Canned/Frozen: PDP data from 2002-2003 was used for succulent peas. A total of 521 samples were analyzed for lambda-cyhalothrin and R157836. The combined residues of lambda-cyhalothrin and R157836 were not detected in any samples. The estimated maximum %CT for succulent peas of 2.5% was used for the acute dietary risk assessment and the estimated average %CT of 1% was used for the chronic dietary risk assessment.

Field Trial Data for Individual Crops: Cucumbers, cantaloupes, and summer squash were translated to other cucurbit vegetables in accordance with HED SOP 2000.1, "Guidance for Translation of Field Trial Data from Representative Commodities in the Crop Group Regulation to Other Commodities in Each Crop Group/Subgroup" 9/12/2000. Total residue levels for each sample were calculated as the sum of the residues for lambda-cyhalothrin and its epimer R157836. For those residues which are <LOQ (Limit of Quantitation),  $\frac{1}{2}$  LOQ was used in the calculation.

Cucumber (MRID# 46665302): Seven cucumber field trials were carried out in 2000. Fourteen samples were analyzed for lambda-cyhalothrin and R157836. The combined residues of lambda-cyhalothrin and R157836 were detected in 8 samples.

Cantaloupe (MRID# 46665301): Six cantaloupe field trials were carried out in 2000. Twelve samples were analyzed for lambda-cyhalothrin and R157836. The combined residues of lambda-cyhalothrin and R157836 were detected in 6 samples.

Potato (MRID# 46665304): Sixteen potato field trials were carried out in 2000. Thirtytwo samples were analyzed for lambda-cyhalothrin and R157836. The combined residues of lambda-cyhalothrin and R157836 were not detected in any samples. The  $\frac{1}{2}$  LOQ value for lambda-cyhalothrin and R157836 was used for the 32 samples.

Summer Squash (MRID# 46665303): Five summer squash field trials were carried out in 2000. Ten samples were analyzed for lambda-cyhalothrin and R157836. The combined residues of lambda-cyhalothrin and R157836 were detected in 3 samples.

#### Food Handling Establishment

The tolerance for the established use for lambda-cyhalothrin is 0.01 ppm, based upon the LOQ for the analytical method. This value was used in the chronic dietary exposure assessment.

#### Usage Information

The screening level estimates of agricultural uses (SLUA) for lambda-cyhalothrin were provided by BEAD based on data years 1999-2004 (A. Halvorson, SLUA, Sept 17 2006). The estimated maximum %CT for each commodity was used for the acute dietary risk assessment and the estimated weighted average %CT for each commodity for the chronic dietary risk assessment. Where no further information was available and for new uses, 100%CT was assumed. See Attachment 6.

#### Processing Information:

Studies to determine the residues of lambda-cyhalothrin after processing have been conducted on apples, peaches, dried prunes, and canola, (PP#0F6092, W. Cutchin, Jun 27 2002). The residues in apples after peeling, cooking, and canning declined significantly for an average concentration factor of 0.08X. The apple processing factor was applied to apple and pear processed food forms. Residues in peaches after peeling and canning declined significantly to an average concentration factor of 0.04X. Residues in peaches after canning did not concentrate. The peach processing factor was applied to peach and apricot processed food forms. Residues in prunes dried indicate concentration of lambda-cyhalothrin up to 1.4X. The results of the canola processing study indicates no concentration of residues in meal and approximately a 1.7 - 2.5X concentration of lambda-cyhalothrin and 3.3 - 5X for R157836 in oil. The study concludes that the appropriate oil concentration factor is 2.3X. The results of the wheat processing study

---

indicate concentration of lambda-cyhalothrin residues in wheat bran up to 3X (PP#9F3770, 7F3560, J. Morales, Dec 16 1994). The wheat bran processing factor was applied to the brans of wheat, barley, and oats. The brans of rye and buckwheat are not listed as food commodities in DEEM. See Attachment 7.

### **III. Drinking Water Data**

The drinking water residues used in the dietary risk assessment were provided by the Environmental Fate and Effects Division (EFED) in the following memorandum: "Tier I Estimated Environmental Concentrations of Lambda-Cyhalothrin and It's Transformation Product of Concern XV for the Use in the Human Health Risk Assessment" (J.Melendez, DPNum 324222, 330149, Oct 26 2006) and incorporated directly into this dietary assessment. Water residues were incorporated in the DEEM-FCID into the food categories "water, direct, all sources" and "water, indirect, all sources."

The EDWCs for lambda-cyhalothrin and degradate were unrefined and calculated using SCI-GROW (Screening Concentration In Ground Water) and FIRST for use in the human health risk assessment. The estimated groundwater concentrations for lambda-cyhalothrin calculated using SCI-GROW were not used in the assessment because residues are shown to be much higher in surface water.

The EDWCs for lambda-cyhalothrin were calculated based on a maximum application rate of 0.5 lb a.i./A/season for seed orchards (ground application) for surface and ground waters concentrations. A default Percent Cropped Area (PCA) factor of 0.87 (87%) was applied to the seed orchards scenario. The seed orchards scenario using FIRST model produced the highest concentrations. The acute drinking water concentration in surface water is 5.35 ppb of lambda-cyhalothrin and degradate. The chronic drinking water concentration is 0.130 ppb.

### **IV. DEEM-FCID™ Program and Consumption Information**

Lambda-cyhalothrin acute and chronic dietary exposure assessments were conducted using the Dietary Exposure Evaluation Model software with the Food Commodity Intake Database (DEEM-FCID™, Version 2.03), which incorporates consumption data from USDA's Continuing Surveys of Food Intakes by Individuals (CSFII), 1994-1996 and 1998. The 1994-96, 98 data are based on the reported consumption of more than 20,000 individuals over two non-consecutive survey days. Foods "as consumed" (e.g., apple pie) are linked to EPA-defined food commodities (e.g. apples, peeled fruit - cooked; fresh or N/S; baked; or wheat flour - cooked; fresh or N/S, baked) using publicly available recipe translation files developed jointly by USDA/ARS and EPA. For chronic exposure assessment, consumption data are averaged for the entire U.S. population and within population subgroups, but for acute exposure assessment are retained as individual consumption events. Based on analysis of the 1994-96, 98 CSFII consumption data,

---

which took into account dietary patterns and survey respondents, HED concluded that it is most appropriate to report risk for the following population subgroups: the general U.S. population, all infants (<1 year old), children 1-2, children 3-5, children 6-12, youth 13-19, adults 20-49, females 13-49, and adults 50+ years old.

For chronic dietary exposure assessment, an estimate of the residue level in each food or food-form (e.g., orange or orange juice) on the food commodity residue list is multiplied by the average daily consumption estimate for that food/food form to produce a residue intake estimate. The resulting residue intake estimate for each food/food form is summed with the residue intake estimates for all other food/food forms on the commodity residue list to arrive at the total average estimated exposure. Exposure is expressed in mg/kg body weight/day and as a percent of the cPAD. This procedure is performed for each population subgroup.

For acute exposure assessments, individual one-day food consumption data are used on an individual-by-individual basis. The reported consumption amounts of each food item can be multiplied by a residue point estimate and summed to obtain a total daily pesticide exposure for a deterministic exposure assessment, or “matched” in multiple random pairings with residue values and then summed in a probabilistic assessment. The resulting distribution of exposures is expressed as a percentage of the aPAD on both a user (i.e., only those who reported eating relevant commodities/food forms) and a per-capita (i.e., those who reported eating the relevant commodities as well as those who did not) basis. In accordance with HED policy, per capita exposure and risk are reported for all tiers of analysis. However, for tiers 1 and 2, any significant differences in user vs. per capita exposure and risk are specifically identified and noted in the risk assessment.

## V. Toxicological Information

The risk assessment team re-evaluated the toxicology data and decided endpoints for lambda-cyhalothrin in the concurrent human health risk assessment (DPNum 313315, W. Drew). The endpoints are summarized in Table 2.

<b>Table 2. Summary of Toxicological Doses and Endpoints for lambda-cyhalothrin for Use in Dietary Exposure Assessment</b>			
Exposure Scenario	Dose Used in Risk Assessment, UF	Hazard and Exposure Based FQPA Safety Factor	Study and Toxicological Effects
Acute Dietary General US pop.	NOAEL = 0.5 mg/kg/day  UF = 100  <b>Acute RfD</b> = 0.005 mg/kg/day	FQPA SF = 1X  $aPAD = \frac{\text{acute RfD}}{\text{FQPA SF}}$  <b>aPAD</b> = 0.005 mg/kg/day	Chronic Dog Study ( $\lambda$ -cyhalothrin) LOAEL = 3.5 mg/kg/day based on clinical signs of neurotoxicity (ataxia) observed from Day 2, 3-7 hours post-dosing
Chronic Dietary all populations	NOAEL= 0.1 mg/kg/day  UF = 100  <b>Chronic RfD</b> = 0.001 mg/kg/day	FQPA SF = 1X  $cPAD = \frac{\text{chronic RfD}}{\text{FQPA SF}}$  <b>cPAD</b> = 0.001 mg/kg/day	Chronic Dog Study ( $\lambda$ -cyhalothrin) LOAEL = 0.5 mg/kg/day based on clinical signs of neurotoxicity (abnormal gait) in two dogs
Cancer (oral, dermal, inhalation)	Classification: “not likely to be carcinogenic to humans” based on the absence of significant tumor increases in two adequate rodent carcinogenicity studies.		

## VI. Results/Discussion

As stated above, for acute and chronic assessments, HED is concerned when dietary risk exceeds 100% of the PAD. The DEEM-FCID™ analyses estimate the dietary exposure of the U.S. population and various population subgroups. The results reported in Tables 3 and 4 are for the general U.S. Population, all infants (<1 year old), children 1-2, children 3-5, children 6-12, youth 13-19, females 13-49, adults 20-49, and adults 50+ years.

### Results of Acute Dietary Exposure Analysis

The acute dietary exposure estimates from combined food and drinking water are below HED’s level of concern (<100% aPAD) at the 99.9<sup>th</sup> percentile of exposure (Table 3). Lambda-cyhalothrin dietary exposure at the 99.9<sup>th</sup> percentile from food and drinking water is 46% of the aPAD for the U.S. population and 61% of the aPAD for all infants (<1 yr), the most highly exposed population subgroup.

**Table 3. Results of Acute Dietary (Food and Drinking Water) Exposure Analysis Using DEEM FCID**

Population Subgroup	aPAD (mg/k g/day)	95 <sup>th</sup> Percentile		99 <sup>th</sup> Percentile		99.9 <sup>th</sup> Percentile	
		Exposure (mg/kg/day)	% aPAD*	Exposure (mg/kg/day)	% aPAD*	Exposure (mg/kg/day)	% aPAD*
General U.S. Population	0.005	0.000662	13%	0.001134	23%	0.002275	46%
All Infants (< 1 year old)	0.005	0.001308	26%	0.001855	37%	<b>0.003031</b>	<b>61%</b>
Children 1-2 years old	0.005	0.001166	23%	0.001732	35%	0.002714	54%

Results of Chronic Dietary Exposure Analysis

The chronic dietary exposure estimates from food and drinking water using the seed orchards scenario are below HED's level of concern (<100% cPAD) for the U.S. population and all population subgroups. Lambda-cyhalothrin dietary exposure from food and drinking water for the U.S. population is 17% of the cPAD and 50% of the cPAD for children 1-2 years old, the most highly exposed population subgroup.

**Table 4. Summary of Dietary Exposure (Food and Drinking Water) and Risk for lambda-cyhalothrin**

Population Subgroup	Acute Dietary (99.9 Percentile)		Chronic Dietary		Cancer	
	Dietary Exposure (mg/kg/day)	% aPAD	Dietary Exposure (mg/kg/day)	% cPAD	Dietary Exposure (mg/kg/day)	Risk

## VII. Characterization of Inputs/Outputs

The acute and chronic dietary exposure assessments were refined through the use of experimentally determined processing factors, DEEM 7.81 default processing factors, and percent crop treated estimates provided by BEAD. The anticipated residue estimates are based primarily on USDA PDP monitoring data, field trial data and beef-fat market basket survey. The monitoring data did analyze for lambda-cyhalothrin and the metabolite of concern R157836. HED concludes that the exposure estimates provided in this document are unlikely to underestimate actual exposure.

**Residue Characterization:** Residue field trial data are adequate to support the established and proposed lambda-cyhalothrin tolerances. The nature of the residues of lambda-cyhalothrin in plants and animals is understood.

**Translation of Residue Data:** Translations were made for apple, wheat, onion, peach, and pear PDP data in accordance with HED SOP 99.3. Cucumber, cantaloupe, and summer squash field trial data was used in accordance with HED SOP 2000.1 for the entirety of cucurbit vegetables (crop group 9). Peas and beans (crop group 6) used the residue field trial data and sweet pea PDP data for the entirety of each subgroup in accordance with HED SOP 99.3 and HED SOP 2000.1.

---

Processing Factors: Processing studies were available for apples, peaches, dried prunes, canola and wheat bran as well as cooking studies for apples and peaches. The apple juice and cooking processing factors were applied to pears. The peach canning processing factor was applied to apricots. The wheat bran processing factor was applied to the brans of wheat, barley, and oats. No other processing factors were extended to other commodities.

Adequacy of %CT data: Percent crop treated data have been provided by BEAD for most commodities in the analysis. 100%CT was assumed for new uses and for existing uses where no further information was available.

### **VIII. Conclusions**

Acute and chronic dietary (food and water) exposure assessments were conducted using the Dietary Exposure Evaluation Model software with the Food Commodity Intake Database (DEEM-FCID™, Version 2.03), which uses food consumption data from the USDA's Continuing Surveys of Food Intakes by Individuals (CSFII) from 1994-1996 and 1998. The acute and chronic dietary risk assessments were conducted for all supported lambda-cyhalothrin food uses and were performed to support Section 3 requests on barley, oat, rye, wild rice, buckwheat, pistachio, cucurbit vegetables (crop group 9), grass forage & hay (crop group 17), and tuberous & corm vegetables (crop group 1-c). The anticipated residue (AR) estimates are based primarily on PDP monitoring data, field trial studies, and market basket survey for beef-fat.

The acute dietary exposure estimates from combined food and drinking water are below HED's level of concern (<100% aPAD) at the 99.9<sup>th</sup> percentile of exposure (Table 3). Lambda-cyhalothrin dietary exposure at the 99.9<sup>th</sup> percentile from food and drinking water is 46% of the aPAD for the U.S. population and 61% of the aPAD for all infants (<1 yr), the most highly exposed population subgroup.

The chronic dietary exposure estimates from food and drinking water are below HED's level of concern (<100% cPAD) for the U.S. population and all population subgroups. Lambda-cyhalothrin dietary exposure from food and drinking water for the U.S. population is 17% of the cPAD and 50% of the cPAD for children 1-2 years old, the most highly exposed population subgroup.

33 Prunes & Plums *	<500	5	5
34 Pumpkins	<500	5	10
35 Rice	10,000	15	30
36 Seed Crops (NPUD '02)	<500	25	
37 Sod (NPUD '02)	<500	5	
38 Sorghum	1,000	<1	<2.5
39 Soybeans	30,000	5	10
40 Spinach	<500	5	5
41 Squash	<500	<1	10
42 Strawberries	<500	<1	<2.5
43 Sugarcane	1,000	5	10
44 Sunflowers	7,000	10	20
45 Sweet Corn	20,000	45	60
46 Tobacco	<500	<1	5
47 Tomatoes	4,000	20	20
48 Walnuts	1,000	5	5
49 Watermelons	<500	<1	<2.5
50 Wheat	9,000	<1	<2.5

All numbers rounded.

'&lt;500' indicates less than 500 pounds of active ingredient.

Last Revised on 03/01/2006

## Attachment 7: Processing Factors used for lambda-cyhalothrin Acute and Chronic Dietary Analysis

Processing Factors used for lambda-cyhalothrin Acute and Chronic Dietary Analysis		
Commodity	Processing Factor	Source
Apples - dried	8.0	DEEM-FCID Default Processing Factor
Apples - juice/cider	1.3	Default Processing Factor Also used for pear juice
Apple – peeling, cooking, canning study <sup>1</sup>	0.08	Processing Study (MRID# 45443104) Also used for pear processed food forms
Apricots – dried	6.0	Default Processing Factor
Beef – dried	1.92	Default Processing Factor
Canola – oil <sup>1</sup>	2.3	Processing Study (MRID# 45443103)
Cherries – juice	1.5	Default Processing Factor
Corn grain - sugar/hfcs	1.5	Default Processing Factor
Onions - dehydrated or dried	9.0	Default Processing Factor
Peaches – peeling and canning study <sup>1</sup>	0.04	Processing Study (MRID# 45443105) Also used for apricot processed food forms
Peaches – dried	7.0	Default Processing Factor
Peanuts – butter	1.89	Default Processing Factor
Pears – dried	6.25	Default Processing Factor
Plums – prunes (dried) processing study <sup>1</sup>	1.4	Processing Study (MRID# 45007007)
Plums - prunes (juice)	1.4	Default Processing Factor
Potatoes/White – dry	6.5	Default Processing Factor
Tomatoes – dried	14.3	Default Processing Factor
Tomatoes – juice	1.5	Default Processing Factor
Tomatoes - paste	5.4	Default Processing Factor
Tomatoes - puree	3.3	Default Processing Factor
Wheat – bran processing study <sup>2</sup>	3	Processing Study (MRID# 433308-01)

1 - These processing studies are reviewed in "Request for the Use of Lambda-Cyhalothrin in/on Canola, Pome Fruits, Stone Fruits, Tree Nuts, Almond Hulls, and Tobacco including Apple and Peach Cooking Studies. Evaluation of Analytical Method and Magnitude of the Residue Data" (PP#0F6092, DP Barcode: D262858, D276160 W. Cutchin, Jun 27 2002).

2 - This processing study is reviewed in "Cyhalothrin. Anticipated Residues for Dietary Risk Assessment. CBTS#'s 14,274, 14,415, and 14,558" (9F3770 and 7F3560, D206401 and D208492, J. Morales, Dec 16 1994).
