METHOXYCHLOR 5 GRANULAR

INSECTICIDE

DIRECTIONS FOR USE

Methoxychlor 5 Granular is recommended in the Midwest and Northeast for use as a mosquito larvicide, applied as a pre-hatch winter treatment for control of "spring brood" mosquito larvae and as a surface treatment to water breeding sites when larvae are present during the spring and summer.

Apply at the following rates by aircraft or with a crank-operated spreader similar to that used for spreading seed and fertilizer. Apply only to known mosquito breeding areas. Use the recommended dosages only in intermittently flooded areas, stagnant water, temporary rain pools and sloughs.

Pre-hatch - make a single application during winter and early spring at the rate of 10 to 20 pounds per acre.

Larvicide - make one or more applications to the source as needed for succeeding broods during the spring and summer. Apply at the rate of 3½ to 10 pounds per acre.
