

# Speciated PM<sub>2.5</sub> Data Needs for Modeling

Brian Timin

EPA/OAQPS/EMAD

Air Quality Modeling Group

May 23, 2000

# Purpose

- ⊗ Why do models need ambient data?
  - ⊖ Background on photochemical modeling
- ⊗ Why is speciated PM data important for modeling?
  - ⊖ PM speciation needs from a modeling perspective

# Photochemical Grid Modeling (PM<sub>2.5</sub> and Ozone)

- ⊗ The purpose of grid modeling is to predict the effects of future control strategies.
  - ⊖ Controls necessary for SIP attainment demonstrations (States)
  - ⊖ Air quality impacts of national rules (EPA)
- ⊗ Basic premise- "If we can replicate the past, we can predict the future."

# Photochemical Modeling- Process

- ⊗ Model historical episodes or a full year
  - ⊖ Inputs consist of gridded emissions and meteorological data
- ⊗ **Evaluate model performance with historical ambient data**
  - ⊖ Ozone
    - ⊗ Ozone, NO<sub>x</sub>, NO<sub>y</sub>, VOC, CO
  - ⊖ PM<sub>2.5</sub>
    - ⊗ PM mass, PM species (SO<sub>4</sub>, NO<sub>3</sub>, OC, EC, etc.), ammonia, nitric acid

# Photochemical Modeling

- ⊗ If model performance is “acceptable” then the modeling system can be used to predict air quality in the future.
- ⊗ Emissions are then projected to a future year and the model is run again (the meteorology is held constant)
  - ⊖ The difference between the base and future year is the predicted future air quality impacts
  - ⊖ The model can be run again with alternative future year strategies

# Why Do Models Need Speciated $PM_{2.5}$ Ambient Data?

- ⊗ Performance evaluations
- ⊗ Control strategy selection
- ⊗ Attainment demonstrations

# Model Performance- PM<sub>2.5</sub>

- ⊗ PM<sub>2.5</sub> is difficult to model because it is a mixture of many different pollutants
  - ⊖ Both primary and secondary components
  - ⊖ Secondary components form through different processes
- ⊗ Need to verify model performance for each of the PM<sub>2.5</sub> components
- ⊗ **A full evaluation cannot be completed without adequate historical speciated PM<sub>2.5</sub> data**

# Performance Evaluations

- ⊗ Comparisons of model output to ambient data provide confidence that models are working correctly.
- ⊗ Want to know that models are giving the right answers for the right reasons.
  - ⊖ This is especially important for secondary pollutants

# Right Answer for the Wrong Reasons- Example

⊗ Model predicts 30 ug/m<sup>3</sup> of PM<sub>2.5</sub>

- ⊖ Sulfate- 15 ug/m<sup>3</sup>
- ⊖ Nitrate- 5 ug/m<sup>3</sup>
- ⊖ Organic carbon- 3 ug/m<sup>3</sup>
- ⊖ Elemental carbon- 5 ug/m<sup>3</sup>
- ⊖ Crustal- 2 ug/m<sup>3</sup>

⊗ FRM monitor measured 30 ug/m<sup>3</sup>

⊗ Collocated speciation monitor measured 30 ug/m<sup>3</sup>

- ⊖ Sulfate- 5 ug/m<sup>3</sup>
- ⊖ Nitrate- 16 ug/m<sup>3</sup>
- ⊖ Organic carbon- 6 ug/m<sup>3</sup>
- ⊖ Elemental carbon- 2 ug/m<sup>3</sup>
- ⊖ Crustal 1 ug/m<sup>3</sup>

# Control Strategy Selection

- ⊗ Future year control strategies may be necessary to meet the NAAQS or Regional Haze rules
- ⊗ Most PM control strategies don't affect all PM components
  - ⊖ Primary species don't interact with each other
  - ⊖ Secondary PM chemistry is complicated
    - ⊗ NO<sub>x</sub> strategies mostly affect nitrates, but also affect sulfates and secondary organic carbon

# Control Strategy Selection

- ⊗ The relative importance of each  $PM_{2.5}$  component in each area will determine the effectiveness of control strategies.
- ⊗ **Speciated  $PM_{2.5}$  data is needed to help choose and prioritize potential control strategies.**

# Attainment Demonstrations

- ⊗ Historically, model attainment demonstrations had to show “ absolute attainment” of the NAAQS in every modeled grid cell
  - ⊖ One hour ozone standard
    - ⊗ All grid cells had to predict < 125 ppb on each modeled day

# Attainment Demonstrations for PM<sub>2.5</sub>

---

- ⊗ Draft PM<sub>2.5</sub> modeling guidance was released in April 2000
  - ⊖ New proposed attainment demonstration uses a “relative test” based on historical ambient measurements
  - ⊖ Example-
    - ⊗ Given an annual standard of 15 ug/m<sup>3</sup> and an observed PM<sub>2.5</sub> value of 25 ug/m<sup>3</sup>
    - ⊗ The model would need to show a 40% reduction in PM<sub>2.5</sub>  $((25-15)/25*100)$  to pass the test.

# Attainment Demonstrations for PM<sub>2.5</sub>

---

- ⊗ The proposed attainment test uses component specific reduction calculations
  - ⊖ The % reduction in each PM<sub>2.5</sub> component is calculated separately
    - ⊗ This allows flexibility to combine the results from different modeling techniques, if necessary
      - Urban, fine scale primary PM modeling
      - Regional scale secondary PM modeling
  - ⊖ **Speciated PM<sub>2.5</sub> data is needed in order to implement the proposed attainment test**

# PM<sub>2.5</sub> Speciation Data Needs

- ⊗ How much speciation data do we need and where do we want it?
  - ⊖ The more the better
  - ⊖ Highest priority is in areas with the highest FRM mass measurements
  - ⊖ Should collocate with FRM monitors, if possible
  - ⊖ Data also needed in rural areas

# Summary

## ⊗ **PM models need speciated PM<sub>2.5</sub> data**

### ⊖ Performance Evaluations

- ⊗ Speciated ambient data is needed to verify the model predictions for each PM component

### ⊖ Control strategies

- ⊗ Speciated data is needed to provide information for selecting future controls

### ⊖ Attainment demonstrations

- ⊗ Speciated data is needed to implement the proposed “relative” attainment test
