meet all of the conditions may be rejected, if appropriate. In sum, the reviewer is to take into account the totality of factors related to the test methodology and results in determining the acceptability of the study.

# Data Evaluation Report on the Acute Dietary Toxicity of Pyrasulfotole to Avian Species {*Anas platyrhynchos*}

PMRA Submission Number 2006-2445

EPA MRID Number 468017-31

## EXECUTIVE SUMMARY:

The acute dietary toxicity of Pyrasulfotole to 10-day old Mallards, *Anas platyrhynchos*, was assessed over 8 days (5 days on treated feed and 3 day recovery period). Pyrasulfotole was administered to the birds in the diet at mean measured concentrations of 306, 605, 1275, 2657, and 5089 mg a.i./kg dw of diet (75, 143, 280, 597, and 1,067 mg a.i./kg bw daily dietary dose, respectively). The acute dietary LC<sub>50</sub> was >5089 mg ai/kg diet. The NOAEC was 5089 mg a.i./kg diet. According to the US EPA classification, Pyrasulfotole would be classified as practically non-toxic to Mallards on an acute dietary basis.

There were no mortalities in the control or treatment groups. No treatment-related clinical signs of toxicity were observed during the study. There were no adverse effects on body weights or feed consumption during the exposure portion of the study. During the recovery period, there were statistically significant reductions in body weight gain (68-88%) at the 605, 1275, and 2657 mg a.i./kg diet treatment levels, but not the highest treatment level (5089 mg a.i./kg diet). Furthermore, there were no statistically significant differences in the body weight of the different treatment groups at the study termination. Therefore, the observed reduction in growth rate for the middle three treatment levels during the recovery period was not thought to adversely affect mallard growth.

Additionally, several birds in the 605, 1275, 2657, and 5089 treatment groups, after being necropsied, had visible yolk stalk diverticulum. The study author considered this a normal finding for mallards, however, the potential biological significance of this finding is unknown.

This toxicity study is classified as **ACCEPTABLE**, is scientifically sound, and does satisfy the guideline requirement for an acute dietary toxicity study with mallard ducks.

## Results Synopsis

Test Organism Size/Age (Mean Weight): 10 days old, 155.0-163.4 g (treatment means), 136.8-172.3 g (range)

LC<sub>50</sub>: >5089 mg ai/kg diet      95% C.I.: N/A

NOAEC: 5089 mg a.i./kg diet  
Probit Slope: Not calculable      95% C.I.: N/A

**I. MATERIALS AND METHODS**

**GUIDELINE FOLLOWED:** This study was based on procedures of EPA 71-2, OPPTS 850.2200 and OECD Guideline No. 205. The following deviations from U.S. Environmental Protection Agency Series 850-Ecological Effects Test Guidelines (*draft*), OPPTS Number 850.2200, *Avian dietary toxicity test* were noted:

No deviations were noted.

**COMPLIANCE:** Signed and dated GLP, Quality Assurance and No Data Confidentiality statements were provided. The test was conducted according to the US EPA-FIFRA Good Laboratory Practice (40 CFR Part 160).

**A. MATERIALS:**

**1. Test Material** Pyrasulfotole (AE 0317309)

**Description:** Light brown powder

**Lot No./Batch No. :** OP 1-4

**Purity:** 95.4%

**Stability of Compound Under Test Conditions:** Stability of the test material was determined in the 313 and 5000 mg a.i./kg feed after one day. The recoveries were 96-97% of the initial concentrations.

**Storage Conditions of Test Chemicals:** Stored under ambient conditions.

## 2. Test organism:

**Species (common and scientific names):** Mallard duck, *Anas platyrhynchos*  
(EPA recommends using either bobwhite quail or mallard duck.)

**Age at study initiation:** 10 days old  
(EPA recommends: 10-14 days old)

**Weight at study initiation (mean and range):** 155.0-163.4 g (treatment means),  
136.8-172.3 g (range)

**Source:** Whistling Wings, Hanover, Illinois.

## B. STUDY DESIGN:

### 1. Experimental Conditions

a. Range-finding Study: No range-finding study was reported.

b. Definitive Study:

**Table 1: Experimental Parameters**

Parameter	Details	Remarks
		Criteria
<u>Acclimation</u>		
Period:	6 days	
Conditions: (same as test or not)	Same as test	
Feeding:	Teklad Bayer Starter Ration and local tap water were provided <i>ad libitum</i> .	
Health: (any mortality observed)	Birds that appeared healthy were used for testing. There was one mortality during acclimation.	
Pen size and construction materials	Galvanized steel brooders (91L×81W×25H cm).	Recommended pen size is about 35 x 100 x 24 cm
Test duration	5 days with treated feed, and 3 days with untreated feed.	Recommended test duration is 5 days with treated feed and at least 3 days observation with "clean" feed.
<u>Test concentrations</u>		
nominal:	313, 625, 1250, 2500, and 5000 mg a.i./kg	Five or six test concentrations should be used in a geometric scale, unless the LC <sub>50</sub> > 5000 mg ai/kg diet.
measured:	306, 605, 1275, 2657, and 5089 mg a.i./kg

EPA MRID Number 468017-31

## II. RESULTS AND DISCUSSION:

### A. MORTALITY:

There were no mortalities in the control or treatment groups. The NOAEC based on mortality was  $\geq 5089$  mg a.i./kg.

Table 3: Effect of Pyrasulfotole on Mortality of *Anas platyrhynchos*

Treatment (mg ai/kg diet) measured (nominal) conc.	No. of birds per treatment	Cumulative mortality							
		day 1	day 2	day 3	day 4	day 5	day 6	day 7	day 8
Control	10	0	0	0	0	0	0	0	0
306 (313)	10	0	0	0	0	0	0	0	0
605 (625)	10	0	0	0	0	0	0	0	0
1275 (1250)	10	0	0	0	0	0	0	0	0
2657 (2500)	10	0	0	0	0	0	0	0	0
5089 (5000)	10	0	0	0	0	0	0	0	0
NOAEC	$\geq 5089$ mg a.i./kg								
LC <sub>50</sub>	$> 5089$ mg a.i./kg								
Reference chemical	mortality	N/A							
	LC <sub>50</sub>	N/A							
	NOEC	N/A							

### B. SUB-LETHAL TOXICITY ENDPOINTS:

No treatment-related clinical signs of toxicity were observed during the study. There were no adverse effects on body weights or feed consumption during the exposure portion of the study. Significant reductions in body weight gain were detected in the 605, 1275, and 2657 mg a.i./kg diet treatment groups. Because these effects were not dose dependent, and because body weight at the end of the study did not differ among treatment groups the NOAEC based on body weights and feed consumption was determined to be  $\geq 5089$  mg a.i./kg diet.

No treatment-related findings were observed in postmortem examinations. Several birds in the 605, 1275, 2657, and 5089 treatment groups had visible yolk stalk diverticulae; the author considered this a normal finding for mallards and it was not considered an adverse effect.

Reference chemical	NOEC	N/A				
	EC <sub>50</sub>	N/A				

**C. REPORTED STATISTICS:**

The LC<sub>50</sub> could not be calculated because there were no mortalities. The bodyweight and growth data were analyzed using the chi-square test for normality and the Levene's test for homogeneity of variance. The body weight treatment group data were compared to the control using Dunnett's one-tailed test ( $p > 0.05$ ). The statistical analyses on body weight were conducted using the TOXSTAT version 3.4 computer program. The study author-reported NOAEC was 5089 mg a.i./kg feed. Mean measured concentrations were used in all estimations. Feed consumption data were not analyzed statistically.

**D. VERIFICATION OF STATISTICAL RESULTS:**

Statistical Method: With the exception of the 605 mg ai/kg diet treatment group, body weight gain was higher in the treatment groups than in the control group during the exposure period; the reduction in the 605 mg ai/kg diet group was less than 1%. As a result, the toxicity values for body weight gain during the exposure period could be visually determined. Body weight gain during the recovery period was analyzed using ANOVA, followed by Dunnett's test, after confirming that data satisfied the assumptions of normality and homogeneity of variances; this analysis was conducted using Toxstat statistical software.

LC<sub>50</sub>: >5089 mg ai/kg diet      95% C.I.: N/A

NOAEC: 5089 mg a.i./kg diet

## E. STUDY DEFICIENCIES:

There were no study deficiencies.

## F. REVIEWERS' COMMENTS:

Results of the reviewers' statistical verification and conclusions were similar to the study author's. Both the reviewers and study author detected significant reductions in body weight gain in the 605, 1275, and 2657 mg ai/kg diet treatment groups during the recovery period. The study author dismissed these substantial reductions in weight gain (68-88%) because they were not dose dependent. The observed reductions in body weight gain during the recovery phase coincided with a reduction in feed consumption at those treatment levels. It is possible that there was some food avoidance occurring at these middle doses, however it is unlikely to be treatment related as food consumption and growth were not affected during the actual exposure period. The reviewers therefore agree with the study author that the observed decrease in growth rate at the middle concentrations is not a biologically significant sublethal effect, and suggest that the NOAEC is 5089 mg a.i./kg diet.

## G. CONCLUSIONS:

This study is scientifically sound and is classified as **ACCEPTABLE**. The NOAEC was 5089 mg a.i./kg diet and the LC<sub>50</sub> was >5089 mg a.i./kg diet, the highest treatment group, which categorizes pyrasulfotole as practically non-toxic to Mallard ducks on an acute dietary basis.

LC<sub>50</sub>: >5089 mg ai/kg diet                      95% C.I.: N/A  
NOAEC: 5089 mg a.i./kg diet  
Endpoint(s) affected: None
