7. CONCLUSIONS: Linuron residues accumulated in bluegill sunfish during 28 days of exposure to treated water. Maximum bioconcentration factors were 49 for whole fish, 240 for viscera 39 for muscle and carcass. Residues declined to about 10% of peak values after a 14 day depuration period. At day 28, linuron, desmethyl linuron, norlinuron and conjugated materials were found in the viscera. No analyses were made for residues in edible tissue.

8. RECOMMENDATIONS: Since the octanol/water partition coefficient for linuron is below 1000, no additional data will be required.
