

Study ValidationReviewer: R. BalcombDate: 11/19/80

1. Chemical: Permethrin
2. Purity: 94.8% C14. Permethrin
3. Test type: 21-Day Flow-through Daphnia Reproduction study
4. Organism: Daphnia magna
5. Test Lab: Analytical Bio Chemistry Laboratories Inc.
Columbia, MO
6. Registrant: ICI and FMC
7. Report Date: September 9, 1980 (#23647)
8. Validation Category: Core
9. Abstract:

A dynamic 21 day life cycle toxicity study of ^{14}C -permethrin to Daphnia magna was conducted to determine Maximum Acceptable Toxicant Concentration (MATC) limits. A one-liter proportional diluter system was used to maintain constant test concentrations. Exposure concentrations of ^{14}C -Permethrin were measured radiometrically on days 0, 3, 10, 14 and 21. The mean measured levels of ^{14}C -Permethrin were 29 ng/l, 60 ng/l, 118 ng/l, 271 ng/l and 608 ng/l. These values were not corrected for recovery.*

Survival of adult daphnids after 21 days exposure to ^{14}C -permethrin at 271 ng/l and 608 ng/l ($P=0.05$) was significantly reduced. Complete mortality was observed in the high concentration of 608 ng/l. Production of offspring from adults was significantly reduced ($P=0.05$) at the concentration of 271 ng/l on day 14 and at the concentrations of 271 estimated to be between 60 ng/l and 118 ng/l.

* Recovery from spiked samples averaged 70% of nominal values. See note for Mayfly study (ABC Report No. 23648).

Reviewer comments

- (1) test methodology acceptable
- (2) Statistical conclusions validated (attached)
