Does the environmental fate database for triadimefon support its use on cotton in Texas under an emergency exemption? Please note: Applications are already being made under a crisis exemption issued by the state on June 27, 1991.

1.0 CHEMICAL:

Common Name- Triadimefon

Chemical Name- 1-(4-chlorophenoxy-3,3-dimethyl-1-(1H-1,2,4-trizol-1-yl)-2-butanone

Trade Name- BAYLETON 50% Dry Flowable Fungicide

Chemical Structure-

triadimefon

triadimenol (Baytan)

2.0 TEST MATERIAL: Not applicable.

3.0 STUDY/ACTION TYPE:

The Texas Department of Agriculture requests an EMERGENCY EXEMPTION (Section 18) to use BAYLETON 50% Dry Flowable Fungicide (triadimefon) on cotton to control Southwestern cotton rust during the 1991 growing season.

4.0 DOCUMENT IDENTIFICATION:

- 1. Letter from Texas Department of Agriculture dated 27 June 1991 to Rebecca Cool (Program Manager) outlining the section 18 application.
- 2. An application for a specific exemption from Texas Dept of Agriculture dated 10 July 1991.
- 3. County maps of Texas.
- 4. Product data sheet (label).

7.0 **CONCLUSION**:

Although the environmental fate data for the Terrestrial Food Crop use of triadimefon in not totally complete (reviewed and acceptable according to our Guidelines) at this time, we do have supplemental information for all the data requirements for a field crop use (see the attached One-Liner). The application thoroughly describes our supplemental data, is aware of the potential for triadimefon and the degradate of concern (triadimenol) to leach to ground water, and has recommended ground water advisories be placed on the label (see pp. 8,9 of the application). EFGWB can concur with the granting of an Emergency Exemption (Section 18) to use triadimefon (BAYLETON 50% Dry Flowable Fungicide) to control cotton rust in the Trans-Pecos area of Texas provided ground water in the use sites are protected. The total acreage was increased to 13,000 and the amount of the active ingredient will total 13,000 pounds.

The registrant (Mobay Corp) has committed to doing all the studies needed to meet the data requirements (see the attached Data Table from the Phase 4 Review Package).

EFGWB concludes that the current status of the data requirements (Terrestrial Food crop use) is as follows:

DATA REQUIREMENTS

Hydrolysis Photolysis in Water Photolysis on Soil Aerobic Soil Metabolism Anaerobic Soil Metabolism Adsorption/Desorption Lab Volatility Soil Field Dissipation Long Term Field Dissipation Accum. Confined Rotational Crop Accum. Field Rotational Crop Accumulation in Fish Spray Drift Run-Off Monitoring Grd Water Monitoring

FOOTNOTES:

- 1. Photodegradation in Air (161-4) data requirement is waived because of low vapor pressure (1.5 x 10 mm Hg @ 20 C) and the low mammalian toxicity of the technical product (ratinhalation $LC_{50} > 0.44$ mg/L/hr and rat oral ($LD_{50} > 363$ mg/kg), both in Toxicity Category 3.
- 2. The study was just recently submitted. It will be reviewed when Phase 5 is implemented.
- 3. Data are not applicable to the terrestrial, greenhouse, and residential use pattern.

FOOTNOTES: (continued)

- 4. The study is unacceptable due to soil sterilization by sodium azide; it may be made acceptable if it can be demonstrated that sodium azide did not change the adsorption/desorption of the soil.
- 5. Lab volatility data requirement (163-2) is not required because of low vapor pressure (1.5 x 10 7 mm Hg @ 20 C) and the low mammalian toxicity of the technical product (rat inhalation LC₅₀ >0.44 mg/L/hr; Tox Category 3) and rat oral (LD₅₀ >363 mg/kg; Tox Category 3).
- 6. Long Term Terrestrial Dissipation data (164-5) are reserved pending the results of the Terrestrial (Soil) Dissipation (164-1).
- Field Rotational Crop data (165-2) are reserved pending the results of the Confined Rotational Crop study (165-1).
- The study will be reviewed as part of Phase 5 of FIFRA 1988
- Aquatic Non-Target Organism data (165-5) are reserved pending the results of the Accumulation in Fish study (165-4).
- 10. Spray Drift data (201-1, 202-1) are not required because acute oral, dermal, and acute inhalation toxicities are in Toxicity Category 3 and there are no animal/plant toxicity
- 11. Reserved pending preliminary assessment of potential for leaching to ground water (based upon the results of various laboratory and terrestrial field dissipation studies).
- 12. Reserved pending review of the results of small scale retrospective ground water study (if applicable).
- 13. Reserved pending a preliminary assessments of the potential for runoff to surface water (based upon the results of various laboratory and field dissipation studies).
- 14. Reserved pending a review of the results of the field runoff study (if applicable).

FROM: EPX5275 (TX/DOA)

DATE: June 27, 1991

ATTN: Becky Cool

SUBJ: Requirements of 40 CFR 166.43(a)

Dear Ms. Cool:

This is to advise you that the Texas Department of Agriculture hereby issues a crisis exemption as of this date and authorizes the use of Bayleton 50% Dry Flowable Fungicide for control of southwestern cotton rust (Puccinia cacabata) in American pima and upland cotton. We take this action following consultation with your office by TDA staff person, Elvis Cozart. The requirements of 40 CFR 166.43(b) are addressed below:

- (1) Triadimefon is the common name of the active ingredient in Bayleton 50% Dry Flowable (EPA Reg. No. 3125-320).
- (2) American pima and upland cotton growing adjacent to or in close proximity to grama grass infested pastures and rangeland in Pecos, Reeves and Ward Counties.
- (3) The "use pattern" as defined at 40 CFR 162.3(qq) is as follows.
 - o The target pest is Puccinia cacabata.
 - o Product may be applied utilizing either aerial or ground equipment. Minimum spray volumes per acre shall be 5 gallons for aerial equipment and 20 gallons for ground equipment.
 - Initiation of product application is to follow rainfall events.
 - O Product is to be applied at the rate of 8 oz. (4 oz. A.I.) per acre per application at 10-14 day intervals. DO NOT make more than 4 applications of product per growing season.
 - o DO NOT make an application of product within 61 days prior to harvest.

P.O. Box 12847, Austin, Texas 78711 • (512) 463-7476

- (4) Use of product is authorized to begin on June 27, 1991.
- (5) Based on information supplied to this agency by Mobay Corp., residues of triadimefon in/on cotton seed are not expected to exceed 0.2 ppm. Residues of triadimefon in the process fractions obtained from cotton seed are expected to be less than 0.2 ppm.
- (6) This crisis exemption is directly related to the loss of the EBDC based fungicides

Within 15 days from the issuance of this crisis exemption, this agency will apply to EPA for a specific exemption.

Sincerely,

Barry McBee

Deputy Commissioner

Subject:

Specific exemption application

Triadimefon/Southwestern cotton rust/cotton

Dear Ms Cool:

As a result of the development this season of the endemic disease Southwestern cotton rust in three counties in the Trans-Pecos area of Texas, and the lack of a registered chemical control, the Texas Department of Agriculture issued a crisis exemption for triadimefon on June 27, 1991.

Triadimefon, or Bayleton 50% Dry Flowable Fungicide, has been demonstrated to give suppression of the causal fungal organism, <u>Puccinia cacabata</u>, and was needed because producers have lost the use of EDBC fungicides to control this disease.

The need for triadimefon still persists on a maximum of 3,000 acres of American pima and Upland cotton in Pecos, Reeves and Ward counties. Therefore, the Texas Department of Agriculture hereby applies for a specific exemption to authorize the use of this product to control Southwestern cotton rust during the 1991 growing season. The requirements of 40 CFR 166.20(a,b) and other supporting information are enclosed for your review.

We would very much appreciate an expeditious response to this request.

Sincerely,

Barry R. AcBee

Deputy Commissioner

SUBJ:

Crisis/specific exemption amendment

Triadimefon/cotton/southwestern cotton rust

Dear Me. Cool:

On June 27 of this year, the Texas Department of Agriculture issued a crisis exemption authorizing the use of triadimefon (as Bayleton 50% Dry Flowable Fungicide) for the control of southwestern cotton rust (<u>Puccina cacabata</u>) in American pima and upland cotton. This crisis exemption was restricted to cotton in Pecos, Reeves, and Ward counties.

We were notified yesterday that within the last three days, this disease has now been found to be spreading at an alarming rate in two other counties in the Trans-Pecos area of Texas-El Paso and Hudspeth. According to Texas A&M University specialists in the region, this unusual outbreak of southwestern cotton rust in these two counties is due to a very heavy amount of causal-organism spore-inoculum this year, an increase in acreage of American pima cotton the past few years, and heavier than normal and more frequent rain showers during recent weeks.

Since this additional cotton in the Trans-Pecos area of Texas could incur severe foliage loss and subsequent yield reductions, we hereby amend our crisis exemption of June 27, 1991 as follows:

- o The site will include El Paso and Hudspath counties.
- O Use of Bayleton in the additional sites is authorized to begin on July 23, 1991.

Other requirements are identical to those detailed in the notification on June 27.

This agency has applied for a specific exemption for the use of triadimeton on cotton which we are requesting to be amended as follows:

o Section 166.20(a)(1)(ii): Contact persons.

Add Mr. Phillip Glogoza, Extension Entomologist, 1030 Zaragosa, Suite A, El Paso, TX 79907 (Phone-915-859-7725).

o Section 166.20(a)(3)(i): Sites to be treated.

In addition to the counties listed in our original application, list two additional counties in the Trans-Pecos area of Texas, El Paso and Hudspeth.

o Section 166.20(a)(3)(iv): Acreage proposed for treatment.

Add an additional 10,000 acres to the original estimate of 3,000 for a total of 13,000 acres.

o Section 166.20(a)(3)(v): Quantity of product required.

Change the estimated amount of fungicide required to 13,000 lb. a. i. triadimefon or 26,000 lb. Bayleton 50t Dry Flowable Fungicide.

We very much appreciate your assistance with this exemption under the emergency condition in Trans-Pecos cotton.

Sincerely,

Barry McBee Deputy Commissioner

Section 166.20(a)(2)(i)(A): Identity of pesticide.

EPA Reg. No. 3125-320; U.S. Patent No. 3,912,752-triadimefon (Bayleton 50% Dry Flowable Fungicide). (See Section 3 for labeling examples.)

Section 166.20(a)(3)(i): Sites to be treated.

Product may be utilized to control Southwestern cotton rust, <u>Puccinia cababata</u>, in American pima and upland cotton in the Pecos, Reeves, and Ward counties (Section 4).

Section 166.20(a)(3)(ii): Method of application.

Product may be applied utilizing either aerial or ground equipment. Minimum spray volumes per acre shall be 5 gallons for aerial equipment and 20 gallons for ground equipment.

Section 166.20(a)(3)(iii): Rate of application.

Product is to be applied at the rate of 8 oz. (4 oz. A.I.) per acre per application at 10-14 day intervals. Four applications of product per growing season are authorized.

Section 166.20(a)(3)(iv): Acreage proposed for treatment.

It is estimated that a maximum 3,000 acres of cotton will require treatment for control of Southwestern cotton rust.

Section 166.20(a)(3)(v): Quantity of product required.

750 lbs. a.i.; 1,500 lbs. of product.

- Section 166.20(a)(3)(vi): Qualifications of applicators; requirements and restrictions on use of product.
 - Bayleton 50% Dry Flowable Fungicide (EPA Reg. No. 3125-320) is not classified as a "restricted use" pesticide. Therefore, applicators are not required to be certified to apply the product for its presently registered uses. However, the Texas Department of Agriculture anticipates that practically all of the product will be applied by private applicators or by persons under their direct supervision.
 - O All applicable directions, precautions and restrictions on the EPA-registered label for Bayleton 50% Dry Flowable Fungicide must be followed.
 - o For use only on American pima and Upland cotton growing adjacent to or in close proximity to grama grass-infested pasture and rangeland in Pecos, Reeves and Ward Counties.
 - o Initiation of product application is to follow rainfall events.
 - o Product is to be applied at the rate of 8 oz. (4 oz. A.I.) per acre per application at 10-14 day intervals. DO NOT make more than 4 applications of product per growing season.
 - o Product may be applied utilizing either aerial or ground equipment. Minimum spray volume per acre shall be 5 gallons for aerial equipment and 20 gallons for ground equipment.
 - O DO NOT apply where run-off from areas scheduled for treatment is likely to occur to aquatic habitats (e.g., forecasted weather conditions favor this).
 - O Users are advised not to apply Bayleton 50% Dry Flowable Fungicide where the water table (groundwater) is close to the surface and where the overlying soils are very permeable, i.e., well drained soils such as loamy sands. Your local agricultural agencies can provide further information on the type of soil in your area and the depth to the water table.
 - DO NOT make an application of product within 61 days prior to harvest.
 - O The suggested expiration date for this specific exemption is November 1, 1991.

Section 166.20(a)(4)(i): Alternative methods of control.

Since cotton has been dropped from mancozeb (EBDC) fungicide labels (i.e., in 1989), no chemical controls are available to growers to protect their cotton crops from Southwestern cotton rust. Moreover, even when EBDC fungicides were an alternative, they were only effective when applied before significant development of a coming disease-outbreak, i.e., when used prior to summer rains. Research is underway with various sterol-inhibiting fungicides such as triadimefon and other chemicals in attempt to find a replacement for EBDC fungicides (see section 5).

Section 166.20(a)(4)(ii): Alternative cultural practices.

No feasible alternative cultural practices are available. Obviously, since this disease is specific to the Trans-Pecos area of Texas, and even more specific to (mostly) fields in that region adjacent to grama grass hosts of the disease organism, one nonviable "alternative" would be to avoid planting the more susceptible American pima cotton to these fields.

Section 166.20(a)(5): Effectiveness of proposed use.

Stichler and Black (1990) found that 2 to 3 applications of triadimefon reduced total lesions of Southwestern cotton rust over an untreated control (Section 6).

Section 166.20(a)(6): Anticipated residues.

Based on information supplied to this agency by Mobay Corp., residues of triadimefon in/on cotton seed are not expected to exceed 0.2 ppm. Residues of triadimefon in the process fractions obtained from cotton seed are expected to be less than 0.2 ppm.

Section 166.20(a)(7): Discussion of risk information.

Human Health

Triadimefon (the active ingredient in Bayleton 50% Dry Flowable) is a triazole fungicide compound registered for use on various agricultural crops. This application supports its use on cotton to control southwestern cotton rust in the El Paso valley.

Toxicological Data

Acute exposure data from laboratory animals indicate that triadimefon has moderate mammalian toxicity. Respective median lethal doses of triadimefon reported for oral and dermal routes of exposure in rats are 363 mg/kg and >5,000 mg/kg. Technical triadimefon is shown to cause slight skin irritation. Studies in rats show that triadimefon can induce weak developmental and reproductive effects at high dose levels. The

chemical caused cleft palates in the offspring at levels of 100 mg/kg/day and maternal toxicity (increased motor activity and depression of body weight) at 25 mg/kg/day. It also caused decreased fertility and litter size and some fetotoxic effects. No significant changes were reported in gene mutation and chromosomal tests.

Long-term effects of triadimefon in humans are not known. Rats exposed to lifetime dietary doses of triadimefon showed significantly decreased body weights and decreased levels of red blood cell count and hemoglobin at mid-dose level of 25 mg/kg/day. No evidence of any carcinogenic effects were observed in this 2-year dietary study. No significant toxic effects including cholinesterase inhibition were reported in cows given triadimefon capsules for 28 days at the highest level of 250 ppm.

Risk Assessment

The U.S. Environmental Protection Agency (EPA) or International Agency for Research on Cancer has not evaluated triadimefon for evidence of human oncogenic potential. EPA has calculated an oral RfD (reference dose) of 30 ug/kg/day, based on a No Observed Effect Level of 2.5 mg/kg/day for changes in blood components in the 2-year rat study and applying a safety factor of 100. This RfD will correspond to a maximum triadimefon intake level of 2.1 mg/day for a 70 kg adult without causing any adverse health effects.

Triadimefon has EPA-established tolerance levels on several agricultural crops; the tolerance levels in or on cotton seed is pending EPA review. The proposed tolerances in or on cotton are as follows: cotton seed, 0.2 ppm, cotton seed (meal), 0.05 ppm; cotton seed (cake), 0.05; and cotton seed (oil), 0.05 ppm. The Maximum Theoretical Residue Contribution from the proposed tolerances in cotton seed products is estimated to be 0.013125 ug/kg/day, which will be about 0.0438% of the RfD.

The proposed residue levels on cotton were determined from an application rate (0.223 lb a.i./acre/application) of Bayleton 25% WP. Applications of Bayleton 50% dry flowable at a rate of 0.25 lb a.i./acre maximum up to 4 applications on cotton in accordance with the provisions are not expected to result in significant residue levels (exceeding 1 ppm) in or on cotton seed/cotton seed oil. Assuming that cotton seed products represent 25% of total dietary intake by cattle, the proposed residue level of 0.2 ppm in or on cotton seed would be equal to a dietary concentration of 0.05 ppm. Experimental dosing of cattle (25 ppm triadimefon in the diet on dry weight basis) was shown to result in a maximum concentration of the chemical in milk and meat at 0.0142 and 0.412 ppm, respectively, and therefore, would not be expected to exceed the existing tolerances of 0.04 ppm for milk and 1 ppm for meat. These levels appear to be adequate to protect the public health and should not cause any unreasonable risk to humans due to dietary exposure.

The hazard from triadimefon exposure from its use on cotton appears to be low. Triadimefon has the potential to cause slight skin irritation as well as developmental and reproductive effects at very high dose levels. However, exposure to triadimefon under normal conditions of handling and use (with protective clothing, rubber gloves, and face shields) should present negligible hazard. Following precautionary statements on the product label appears to be adequate for the protection of field workers and mixer/loaders and applicators. No major adverse human health effects would be expected to result by the approval of this registration.

Threatened and Endangered Species

A Section 18 request has been made to allow the use of triadimefon (trade name Bayleton) on cotton to control southwestern cotton rust. The area for use is restricted to Pecos, Reeves and Ward counties.

Triadimefon is a systemic fungicide with protective and curative action. It is an ergosterol biosynthesis inhibitor and a member of the triazole chemical family.

Within this three county area, there are 17 species of special concern as listed by the Texas Parks and Wildlife's Natural Heritage Program (Table 1, Section 11). The toxicological data given below is compiled from The Agrochemicals Handbook, 2nd Ed. 1987 and other sources as listed.

Plants

Triadimefon is known to be phytotoxic when applied at excessive rates, therefore plant species of special concern have been included in this review. There are nine plant species of special concern within this area, eight of these species are Category 1 (C1) or Category 2 (C2) listed.

A C1 listing means that the USFWS has substantial information on biological vulnerability and threats to support proposing to list as endangered or threatened. Data are being gathered on habitat needs and/or critical habitat designations. A C2 listing means that information indicates that proposing to list as endangered or threatened is possibly appropriate, but substantial data on biological vulnerability and threats are not currently known to support the immediate preparation of rules. Further biological research and field study will be necessary to ascertain the status and/or taxonomic validity of the taxa in Category 2.

The plant species are as follows:

<u>Species</u>	County
Bushy wild buckwheat	Pecos
Glass Mountain coral-root	Pecos
Lloyd's hedgehog cactus	Pecos
Phantom Lake tryonia	Reeves
Puzzle sunflower	Pecos, Reeves
Tharp's blue-star	Pecos
Two-spike rock daisy	Pecos
Wright's water-willow	Pecos

Mammals

Triadimefon ranges from slightly to moderately hazardous in rats. The acute oral LD_50 for male rats is 568 mg/kg, and for female rats is 313 mg/kg. The dermal LD_50 for rats is greater than 1000 mg/kg, which is in the range of slightly hazardous (Table 2, Section 11).

Tests indicate that there are few carcinogenic, no mutagenic, and no teratogenic effects from exposure to various amounts of triadimefon. A reproductive study indicated that only at extreme high doses does triadimefon affect male rats.

There are currently no mammalian species of special concern in the reviewed area.

Aves

The acute oral $\rm LD_50$ for canaries is greater than 1000 mg/kg, for Japanese quail is 1750-2500 mg/kg, for mallard ducks is greater than 4,000 mg/kg and for chickens is about 5000 mg/kg. These acute oral $\rm LD_50$'s range between slightly and practically non-toxic. Eight-day dietary studies indicate the same range, with $\rm LC_50$ values of greater than 10,000 mg/kg for mallard ducks and greater than 4640 mg/kg for bobwhite quail (Table 2, Section 11).

There are currently no avian species of special concern within the reviewed area.

Fish

The LC_{50} values for fish species ranges from moderately to slightly toxic. For the bluegill sunfish the 96 hour LC_{50} is 11 mg/l, for orfe it is 13.8 mg/l, and for rainbow trout is 14 mg/l. For carp the 48 hour LC_{50} is 7.6 mg/l (Table 2, Section 11). Within this area there are four threatened or endangered fish species. They are the Comanche Springs pupfish (Reeves County), the Leon Springs pupfish (Pecos County), the

Pecos gambusia (Pecos and Reeves counties), and the Pecos pupfish (Pecos, Reeves, and Ward counties).

Reptiles

There are no known toxicity data for reptilian species for triadimefon. However, given that the reptilian taxon is more closely related to the avian taxon than others, the toxicities between the two animal groups should be similar. There is one state threatened reptilian species in the reviewed area; the Big Bend blackhead snake which is found in Pecos County.

Amphibians

There are no known toxicity data for amphibians, although toxicity data for fish species should be similar. There are currently no amphibian species of special concern within this area.

Nontarget Animals

The only toxicological data available for invertebrate species is for the <u>Daphnia magna</u>. The LC_{50} (48 hour) is 1.6 mg/l, which is in the range of moderate toxicity (Table 2, Section 11). This data is from the <u>1988/89 MSDS Reference for Crop Protection Chemicals</u> book, 1st Ed.

There are three snail species that are of special concern within Pecos County. They are the Diamond Y Spring snail, the Gonzales Spring snail, and the Pecos assiminea snail.

This product is non-toxic to bees.

Summary

Concerning the toxicity to plant species the following restriction is suggested for habitat containing Lloyd's hedgehog cactus:

"Product should be restricted from use within 100 yards of known habitat."

There should be an attempt to reduce excessive exposure to known habitats of the remainder of the plant species listed above.

In addition to the labeled precautions to keep this product out of lakes, streams, and ponds the following label restriction is suggested to protect the fish species found in the reviewed area:

"Do not apply where product run-off is likely to occur to aquatic habitats."

In Reeves County, the above restriction applies mainly to the area where Comanche Springs pupfish resides. This area is delineated by Interstate 10 on the North, on the Southwest by the Jeff Davis county line and on the Southeast by the Pecos County line.

Additionally, the above restriction is provided for the protection of the snail populations within Pecos County.

To determine whether an area is known habitat for a particular species, please contact the Texas Parks and Wildlife's Natural Heritage Program at (512) 448-4311.

Environment

Information available for the product Bayleton 50% Dry Flowable Fungicide (triadimefon) in TDA Pesticide Registration Files includes only the Environmental Fate One Line Summary (Environmental Fate and Groundwater Branch, Environmental Protection Agency, 1990) and a summary from The Agrochemicals Handbook (Royal Society of Chemistry, 1987).

Triadimefon is a triazole with systemic fungicide action. It is absorbed by roots and leaves, readily translocated in young growing tissues, but less readily translocated in older, woody tissues. In plants and in soil, the carbonyl group is reduced to a hydroxyl group, with the formation of triadimenol.

Triadimefon is stable to hydrolysis. (At pH 3, 6 and 9, at least 95% remained after 28 weeks.) It is also stable to photolysis on soil, although photolysis in surface water occurred with a half-life of 10 to 12 hours. Laboratory aerobic soil metabolism half-lives for triadimefon in silty clay loam and sandy loam soils were 6 and 18 days, respectively; the soil half-life in silty clay loam soil under anaerobic lab conditions was 15 days. Dissipation studies show that the product is persistent under field conditions. Parent triadimefon half-lives in sand, fine sandy loam and loam soils were 5.5, 4.5 and 8 months in the 0-6 inch soil layers, and 8.7, 17 and 23 months in the 6-12 inch soil layers, respectively. The triadimenol metabolite half-lives in the sand and fine sandy loam soils were 6 and 24 months in the 0-6 inch soil layers, respectively, and 6.5 months in the 6-12 inch layer of the sand These values indicate that triadimefon and degradate, triadimenol, are sufficiently persistent under normal field conditions to be able to reach groundwater.

Soil partition coefficients (K_d values) for triadimefon in sandy loam, sand, clay loam and silt loam soils were 1.85, 2.4, 2.6 and 6.93, respectively. These values indicate high potential for leaching in soils. Soil R_f factors varied from 0.16 to 0.27 in five soils which ranged from 91 to 0% sand, 1 to 57% silt, 1 to 59% clay, and 0.5 to 5.1% organic matter. These R_f values indicate low potential for movement. The water solubility of triadimefon is 64 mg/L (indicating high leaching

potential) and the log octanol/water partition coefficient is 3.18 (indicating moderate leaching potential).

Aged residues of triadimefon are mobile and have the potential to leach into groundwater. Solubility, soil adsorption, and degradation properties for the degradate, triadimenol, indicate low to high potential for leaching in soils. The range reported for soil adsorption coefficients in three soils (loam, 3.0% organic matter; silty clay, 2.1% organic matter; and sand, 3.7% organic matter) were from 2.37 to 5.26, all values indicating low soil binding potential (high mobility Thin-layer chromatography results in two soils showed potential). frontal R_e values of 0.16 (silty clay, 0.5% organic matter) and 0.58 (sandy loam, 2.3% organic matter) indicating low and intermediate mobility potential, respectively. Triadimenol is stable to hydrolysis, soil surface photolysis, aerobic and anaerobic soil metabolism and volatilization. No apparent hydrolysis occurred at pH 4.5, 7.1 or 9.2. Aerobic half-life was estimated to be 8 to 9 months and anaerobic halflife considerably greater than 8 to 9 months. Half-lives of the metabolite under field conditions, as summarized above, ranged from 6 to 24 months in sand and fine sandy loam soils.

Triadimefon is to be applied at the rate of 8 oz. (4 oz. active ingredient) per acre per application at 10-14 day intervals, with no more than four applications of product per growing season. The area of proposed use is in Reeves, Ward and Pecos counties. Much of the groundwater in this area of use is considered vulnerable to pesticide contamination based on the DRASTIC model evaluation. Based on the proposed use situation and because the product and aged residues are mobile in soil, a groundwater advisory statement would be appropriate. This statement would be to advise the pesticide applicators to protect vulnerable groundwater in the region proposed for use.

In addition to the "Environmental Hazards" language on the federal Bayleton label, the following statements are recommended for the specific exemption label:

Users are advised not to apply Bayleton (triadimefon) where the water table (groundwater) is close to the surface and where the soils are very permeable, i.e., well-drained soils such as loamy sands.

Do not apply when forecasted weather conditions favor runoff from areas scheduled for treatment.

Section 166.20(a)(8): Coordination with other State/Federal agencies.

Other affected state or federal agencies have been notified of TDA's intent to make application to the EPA for this specific exemption. Comments received on this years request will be forwarded to the EPA when and if received.

Section 166.20(a)(9): Notification of registrant.

Mobay Corporation has been notified by phone of TDA's intent to make application to EPA for this specific exemption.

Section 166.20(a)(10): TDA's enforcement authority.

The Texas Department of Agriculture (TDA) is the state lead agency responsible for enforcing the FIFRA, as amended, within the state of Texas. This charge is the result of a grant enforcement agreement between the TDA and EPA. Since specific exemptions are granted pursuant to the authority of FIFRA Section 18, it is TDA's view that we have the legal authority and the responsibility to enforce any special requirements that EPA may see fit to impose on this specific exemption.

TDA's Pesticide Enforcement Program has a staff of Pesticide Specialists located in various areas around the state. These specialists will enforce any special requirements related to this specific exemption.

Section 166.20(a)(11): Repeated uses.

Not applicable.

Section 166.20(b): Information required for a specific exemption.

- (1) Scientific name: <u>Puccinia cababata</u>; common name(s): Southwestern cotton rust.
- (2) Southwestern cotton rust (or "the true rust of cotton") has been recognized as a disease of cotton in the western U. S. for some time and was mentioned in the 1953 Yearbook of Agriculture. This disease was first reported in northern Mexico in 1893 (Section 7). Since then it has been recognized as a problem for cotton in that part of the world and in adjacent areas of the southwestern U. S. Losses from the disease have ranged from ca. 26% to some of Mexico's crop in 1985, to 50-75% to New Mexico cotton in 1959, to 75% damage in Arizona in 1930.

This year conditions of weather and alternate hosts were especially favorable for spread of Southwestern cotton rust in cotton in the Trans-Pecos area of Texas. With the finding of rust on gamma grass alternate hosts--and in cotton fields--and with the threat of showers which would make conditions even more conducive to spread of the disease organism, a crisis situation was declared by TDA on June 27, 1991 and an exemption issued following the requirements of 40 CFR 166.43(b), to authorize the use of triadimefon on cotton in the three west Texas counties (Section 8).

- (3) Not applicable.
- (4) As mentioned previously, Southwestern cotton rust has been a problem in northern Mexico cotton and in cotton in the adjacent areas of the United States Southwest since the late 1800s. In dry years Southwestern cotton rust is less of a problem, but in years with frequent summer showers, infection is severe and can cause defoliation and breaking of stems. This foliage loss can cause premature opening of unripe bolls, reduce yields, and result in quality and harvesting problems. Losses from this disease can be very high and when the damage is severe many of the infested fields may be shredded or plowed. The Balmorhea area of Texas (in the 3-county region) has severe infection about every four or five years when timely showers cause the fungus to release airborne spores that infect the cotton.

The Southwestern cotton rust fungus grows on a grama grass host unrelated to cotton from one summer to the next. In the Balmorhea area of Texas, extension pathologists have found it mainly on Six weeks gramma and Roth Rock gramma. The heavy infection this area had last year indicates that conditions favorable for infection occurred quite frequently during the early summer. Favorable conditions are 90% relative humidity, temperatures below 83 degrees Fahrenheit for 13 hours or longer. These same conditions favor infection on the native grama grass hosts, therefore, there is no doubt that the grama grasses are heavily infected at this time (early July). Early season attacks of rust in cotton are usually light, but with succeeding showers, infections usually increase in severity. Generally the earlier the infection starts, the worse the disease damage gets before the season's end.

The region has had several showers and in early June, cotton scouts in the Balmorhea area were finding rust pustules on cotton leaves. The situation has worsened as the season has progressed into July.

- (4)(i)Texas crop enterprise budgets for 1986-1990 (projections for planning purposes including gross and net returns) for various systems of cotton production in the Trans-Pecos area are presented in Section 9. Also, planted and harvested cotton acreage, yield per acre, and gross return in dollars per acre are presented for 1986-1990.
- (4)(ii&iii) Estimation of the gross and net revenues with and without the availability of Bayleton 50% Dry Flowable Fungicide are based on statistics and budgets available from the Texas Agricultural Extension Service and the Texas Agricultural Statistics Service, and on estimates that a maximum of 2,300 acres of American pima cotton and 700 acres of Upland cotton will be threatened with this disease in Texas this year (Section 10). Therefore, we estimate

that potential losses to Southwestern cotton rust could be as high as \$110,740 for Upland cotton producers and \$648,301 for American pima producers in the absence of triadimefon--for a total potential loss of \$759,041 to producers in the 3-county area. If a minimum multiplier effect of 2 is considered in terms of the effect of this loss of cash flow to the Trans-Pecos economy, then losses would be greater than \$1.5 million.

PRODUCT BULLETIN

This recommendation is made as permitted under FIFRA Section 2(ee) and has not been submitted to or approved by the EPA.

January 16, 1990

FOR USE IN TEXAS ONLY

FIFRA Section 2(ee) Recommendation

BAYLETON 50% Dry Flowable EPA Reg. No. 3125-320

RECOMMENDED APPLICATIONS

The following tank mix recommendations are made for the improved control of specific diseases infesting wheat. Before mixing BAYLETON 50% Dry Flowable with Penncozeb , Clean Crop Mancozeb 80 WP, Clean Crop Mancozeb 4L, or Mancozeb Fungicide by Riverside/Terra Corp., read and carefully observe the precautionary statements, directions of use, and other information appearing on the EPA registered product labels.

CROP	FOR IMPROVED CONTROL OF:	2 OUNCES PER ACRE	2 POUNDS PER ACRE
Wheat	Helminthosporium leaf spots Septoria leaf spots (leaf blotch) Septoria glume blotch Tan spot Rusts	BAYLETON 50% DF	Penncozeb, <u>OR</u> Clean Crop Mancozeb 80 Wettable Powder, <u>OR</u> Clean Crop Mancozeb 4L, <u>OR</u> Mancozeb Fungicide by Riverside/Terra Corp.

This bulletin must be in the possession of the user at time of pesticide application.

IMPORTANT: Before using the products, read and carefully observe directions, cautionary statements and other information appearing on the EPA registered product labels. This product is sold subject to the Conditions of Sale set forth on the container labels.

BAYLETON is a Reg. TM of Bayer AG, Germany.

Penncozeb is a TM of Pennwalt Corporation. Clean Crop is a Reg. TM of United Agri Products, Inc.

PRECAUTIONARY STATEMENTS

HAZARDS TO HUMANS AND DOMESTIC ANIMALS

· 数5.2 编数 [数] 数据 [次 2]

WARNING

Harmful if swallowed, inhaled, or absorbed through the skin. Causes eye irritation. Do not breathe dust or allow to get in eyes, on skin, or on clothing.

Wash hands, arms and face thoroughly with soap and warm water after use and before eating or smoking. Wash all contaminated clothing with soap and hot water before reuse. Do not contaminate feed or food items. Keep out of reach of children.

STATEMENTS OF PRACTICAL TREATMENT

If swallowed, vomiting should be induced. Administer water freely and induce vomiting by giving one dose (1/2 oz. or 15 ml.) of syrup of ipecac. If vomiting does not occur within 10 to 20 minutes, administer second dose. If syrup of ipecac is not available, induce syomiting by sticking finger down throat. Repeat until vomit fluid is clear. Never give anything by mouth to an unconscious person. Professional medical assistance should be secured immediately. u.S. Pztent no. 2.655 Fest of the

If on skin, wash skin immediately with soap and water.

If eyes are contaminated, wash with plenty of water for at least 15 minutes. Get medical

If inhaled, remove to fresh air. If not breathing, give artificial respiration, preferably mouth to mouth. Get medical attention.

About and ha SYMPTOMS OF POISONING: The compound does not cause any definite symptoms that would be diagnostic. Poisoning is accompanied by hyperactivity followed by sedation.

NOTE TO PHYSICIAN: No specific antidote. Treat symptomatically.

ENVIRONMENTAL HAZARDS Do not use on other crops grown for food or forage. Keep out of lakes, streams, and ponds. Do not contaminate water by cleaning of equipment or disposal of wastes. Apply this product only as specified on this label.

Do not make applications when weather conditions favor drift from target area.

BAYLETON 50% Dry Flowable Fungicide

DIRECTIONS FOR USE

It is a violation of Federal law to use this product in a manner inconsistent with its -labeling.

IMPORTANT: Read these entire Directions and Conditions of Sale before using BAYLETON 50% Dry Flowable fungicide.

CONDITIONS OF SALE: THE DIRECTIONS ON THIS LABEL WERE DETERMINED THROUGH RESEARCH TO BE THE DIRECTIONS FOR CORRECT USE OF THIS PRODUCT. THIS PRODUCT HAS BEEN TESTED FOR A RANGE OF WEATHER CONDITIONS SIMILAR TO THOSE WEATHER CONDITIONS THAT ARE ORDINARY AND CUSTOMARY IN THE GEOGRAPHIC AREA WHERE THE PRODUCT IS USED. INSUFFICIENT CONTROL OF PESTS AND/OR INJURY TO THE CROP TO WHICH THE PRODUCT IS APPLIED MAY RESULT FROM THE OCCURRENCE OF EXTRAORDINARY OR UNUSUAL WEATHER, OR FROM FAILURE TO FOLLOW LABEL DIRECTIONS. IN ADDITION, FAILURE TO FOLLOW LABEL DIRECTIONS MAY CAUSE INJURY TO OTHER CROPS, ANIMALS, MAN, OR THE ENVIRONMENT. MOBAY OFFERS, AND THE BUYER ACCEPTS AND USES, THIS PRODUCT SUBJECT TO THE CONDITIONS THAT EXTRAORDINARY OR UNUSUAL WEATHER, OR FAILURE TO FOLLOW LABEL DIRECTIONS ARE BEYOND THE CONTROL OF MOBAY AND ARE, THEREFORE, THE RESPONSIBILITY OF
THE BUYER.

A STATE OF THE STA Add the recommended amount of BAYLETON 50% Dry Flowable into the spray tank while filling with water to the desired level: Operate the agitator while mixing. If other materials are added to the spray tank, the BAYLETON 50% Dry Flowable should be thoroughly dispersed prior to the addition of other materials.

COMPATIBILITY BAYLETON fungicide is physically compatible with many registered insecticides, miticides, and fungicides. To determine the compatibility of BAYLETON fungicide with other products, the following procedure should be followed: Pour the recommended proportions of the products into a suitable container of water, mix thoroughly and allow to stand at least five (5) minutes. If the combination remains mixed or can be re-mixed readily, the mixture is considered physically compatible. For further information contact your local Mobay representative. NOTE TO USER

For worker protection during mixing, loading, and during application, wear a hat, long sleeve shirt, and long legged trousers or overalls. In addition, during mixing and loading, wear rubber or neoprene gloves and a dust mask. Protective clothing should be laundered separately following application.

RECOMMENDED APPLICATIONS

BAYLETON 50% Dry Flowable may be applied in a minimum of 20 gallons of spray solution per acre by ground or in a minimum of 5 gallons of spray solution per acre by aircraft spray equipment except as noted under "Remarks" for each crop. Check equipment calibration frequently. Complete coverage and uniform application are essential for the most effective results, especially when lower spray volumes are applied. If necessary, increase the spray volume per acre for complete crop coverage.

RECOMMENDED APPLICATIONS (Continued)

Do not apply this product through any type of irrigation system.

Consult your State Agricultural Experiment Station or Extension Service Specialist or Mobay representative for guidance on the selection of specific dosage rates and timing of applications appropriate for your specific crop and disease. State regulations may contain additional restrictions or requirements. Check the Remarks and restrictions sections of this label for additional directions.

TANK MIXES

The following tank mix recommendations are made for the improved control of specific diseases. Before mixing BAYLETON 50% Dry Flowable with any other fungicide, read and carefully observe the precautionary statements, directions for use, and other information appearing on the EPA registered product labels. The rates given below for Dithane M-45 fungicide are for the 80% wettable powder formulation.

CROP	Co-Applied Fungicide	For Improved Control of:	BAYLETON . 50% D.F. Rate

RE-ENTRY STATEMENTS

KE-ENIKY STATEMENTS Do not apply this product in such a manner as to directly or through drift expose workers or other persons. The area being treated must be vacated by unprotected persons. Do not enter treated areas without protective clothing until sprays have dried. Because certain states may require more restrictive reentry intervals for various crops treated with this

product, consult your State Department of Agriculture for further information.

(The following may appear on supplemental labeling accompanying the product) Written or oral warnings must be given to workers who are expected to be in a treated area or in an area about to be treated with this product. Oral warnings should include those statements found under the label heading "Precautionary Statements" and "Re-entry 1835 Statements" included on this label. When oral warnings are given, warnings shall be included. given in a language customarily understood by workers. Oral warnings must be given if there is reason to believe that written warnings cannot be understood by workers. Written warnings must include the following information: WARNING, area treated with BAYLETON 50% Dry Flowable on (date of application). Do not enter without appropriate protective clothing until sprays have dried. If on skin, remove contaminated clothing and wash skin immediately with soap and warm water. If eyes are contaminated, wash with flowing water for at least 15 minutes. If swallowed, vomiting should be induced. (See some Precautionary Statements on label).

STORAGE AND DISPOSAL

Pesticide Disposal: Do not contaminate water, food or feed by storage or disposal.

Wastes resulting from the use of this product may be disposed of on site or at an approved waste disposal facility.

Container Disposal: Completely empty carton into application equipment. Then dispose of empty carton in a sanitary landfill or by incineration, or, if allowed by State and local authorities, by burning. If burned, stay out of smoke.

Store in a cool, dry place and in such a manner as to prevent cross contamination with other pesticides, fertilizers, food, and feed. Store in original container and out of the reach of children, preferably in a locked storage area.

Handle and open container in a manner as to prevent spillage. If the container is leaking or material spilled for any reason or cause, carefully sweep material into a pile. Refer to Precautionary Statements on label for hazards associated with the handling of this material. Do not walk through spilled material. Dispose of pesticide as directed above. In spill or leak incidents, keep unauthorized people away. You may contact the Mobay Emergency Response Team for decontamination procedures or any other assistance that may be necessary. The Mobay Kansas City Emergency Response Telephone No. is 816-242-2582, or contact Chemtrec at 800-424-9300.

DITHANE M-45 is a Reg. TM of Rohm and Haas Co.

BAYLETON is a Reg. TM of Bayer AG, Germany.

FOR CONTROL OF SPECIFIED DISEASES ON CERTAIN FIELD. FRUIT AND VEGETABLE CROPS

ACTIVE INGREDIENT:

1-(4-Chlorophenoxy)-3.3-dimethyl-1-(1H -1.2.4- triazol-1-vi)-2-butanone INERT INGREDIENTS: TOTAL

EPA Reg. No. 3125-320

U.S. Patent No. 3,912,752

BAYLETON is a Reg. TM of Bayer AG, Germany Dithane M-45 is a Reg. TM of Rohm and Haas Company

RECOMMENDED USES

Almonds, Apples, Cucurbits, Grapes, Pears, Pineapple, Raspberries, Wheat, Barley, Pine Seedlings, Pine Seed Nurseries, Sugar Beets, and Grasses grown for seed~

RESTRICTIONS ON WAREHOUSE STORAGE

Protect from rain and moisture. Store in a cool, dry place. Do not store next to herbicides. Do not store near feed or food products.

PACKAGING

2 lb. carton, 12 per case. Shipping weight 29 lbs.

BAYLETON 50% Dry Flowable is a unique fungicide which has the ability to control, as well as prevent, certain important fungus diseases, including rusts, powdery mildew and black rot in wheat, barley, grapes, apples, pineapples, pears, pine seedlings, and grasses grown for seed.

BAYLETON 50% Dry Flowable is absorbed rapidly and works systemically from within the plant.

RAYLETON 50% Dry Flowable mixes readily with water to form a suspension that can be used in all convenient hand- and machine- operated sprayers.

AVISO

PRECAUCION AL USUARIO: Si usted no puede leer o entender inglés, no use este producto hasta que la etiqueta le haya sido explicada ampliamente.

(TO THE USER: If you cannot read or understand English, do not use this product until the label has been fully explained to you.)

DIRECTIONS FOR USE

It is a violation of Federal Law to use this product in a manner tent with its labeling.

Add the recommended amount of BAYLETON 50% Dry Flowar the spray tank while filling with water to the desired level. Oper agitator while mixing. If other materials are added to the spray. BAYLETON 50% Dry Flowable should be thoroughly dispersed the addition of other materials.

COMPATIBILITY

BAYLETON fungicide is physically compatible with many regin secticides, miticides, and fungicides. To determine the compati BAYLETON fungicide with other products, the following proshould be followed: Pour the recommended proportions of the p into a suitable container of water, mix thoroughly and allow to least five (5) minutes. If the combination remains mixed or can be it readily, the mixture is considered physically compatible. For furth mation contact your local Mobay representative.

NOTE TO USER

For worker protection during mixing, loading, and during app wear a hat, long sleeve shirt, and long legged trousers or overalls. tion, during mixing and loading, wear rubber or neoprene gloves dust mask. Protective clothing should be laundered separately in application.

RECOMMENDED APPLICATIONS

BAYLETON 50% Dry Flowable may be applied in a minimum lons of spray solution per acre by ground or in a minimum of S spray solution per acre by aircraft spray equipment except as no "Remarks" for each crop. Check equipment calibration frequent plete coverage and uniform application are essential for the mos results, especially when lower spray volumes are applied. If neg crease the spray volume per acre for complete crop coverage.

Do not apply this product through any type of irrigation system Consult your State Agricultural Experiment Station or Extens Specialist or Mobay representative for guidance on the selection dosage rates and timing of applications appropriate for your sp and disease. State regulations may contain additional restrict quirements. Check the Remarks and Restrictions sections of the additional directions.

Pears	Powdery mildew	2 to 8	V₂ to 2	Make the first application at the budburst stage and continue applications at intervals, or as needed. Use the higher label rates under heavy disease pressure extended spray intervals, and/or on highly disease susceptible varieties. A maximum of 24 ounces of BAYLETON 50% DF may be applied per acre p BAYLETON 50% DF may be applied up to the day of harvest. Do not graze in treated orchards.
Grapes	Powdery mildew	2 to 6 ozs./A		GENERAL COMMENTS Use the higher label rates under heavy disease pressure, with extended sprand/or on highly disease susceptible varieties.
	Black rot	Si	tective chedule 2 to 3 orgs./A Post- efection 3 to 4 orgs./A	Fields should be observed closely for early disease symptoms when susceptible are planted and/or under prolonged conditions favorable for disease develops A maximum of 18 ounces of BAYLETON 50% DF may be applied per acresson. BAYLETON 50% DF may be applied up to 14 days before harvest. POWDERY MILDEW: Make the first application pre-bloom and continue applications at 14 to 21 dintervals, or as needed. BLACK ROT: Protective Schedule Make the first application at 10-inch green shoot and continue applications at day intervals through 5° Brix stage or until versison (berry coloring) is comp severe disease conditions and/or on highly susceptible varieties, make application day intervals. Post-infection Schedule During bloom apply within 72 hours after the beginning of an infection perionake spray applications any closer than 7 day intervals. After bloom, continuapplications at rates of 2 to 3 ounces of BAYLETON 50% DF at 7 to 14 day or as needed to maintain control.

		RATE OF BAYLETON	REMARKS (ALSO REFER
CROP	DISEASE	50% DRY FLOWABLE	TO DIRECTIONS FOR USE)
apples (Fresh market only)	Fresh fruit rot (Carato- cystis paradoxa)	131/1 02.	Post-Harvest Treatment: Apply specified dosage in 100 gallons of water to fruit after harvest. Fruit should be dipped or sprayed for thorough coverage and allowed to drain. Limit dipping time to not more than 3 minutes.
Asperries (California (Oaly)	Powdery mildew	4 ounces	Apply specified dosage per acre in not less than 20 gallons of water using ground equipment. Make the first application when disease symptoms first appear and additional applications at 4 to 6 week intervals thereafter as needed. A maximum of 7 total applications may be made in one year with not more than 2 applications within the same 30-day period. Do not harvest within 1 day of application.
UTS Imonds	Blossom blight	oz./A oz./100 gal.1 24 to 32 6 to 8	Make applications at pink bud and full bloom in aerial or ground equipment. Concentrate sprays may be applied provided the amount of BAYLETON 50% DF applied per acre is the same as that which would be applied per acre in a full coverage spray. Do not apply more than 64 ozs. (4 lbs.) of BAYLETON 50% DF per acre per crop season. The last application can be made up to full bloom.
MALL RAINS Theat, orley	Powdery mildew Rusts (stripe,	2 to 6 oz./A 4 to 8 oz./A	Fields should be observed closely for early disease symptoms when susceptible varieties are planted and/or under prolonged conditions favorable for disease development. Apply specified dosage per acre in a minimum of 10 gallons of water per acre by ground equipment or 5 gallons of water per acre by air when disease symptoms first appear on
and comments and a supplicate fraction of the state of the	leaf, and stern) Leaf blotch (Septoria tritici) Barley Scald		leaves or stems. Additional applications should be made if new disease symptoms appear. The total amount of BAYLETON 50% DF should not exceed 16 ozs. per acre per crop season and the last application should not be made within 21 days of harvest. Powdery mildew: In areas having severe powdery mildew infection apply 4 to 6 ozs. of BAYLETON 50% DF per acre. Raste: In areas having severe rust infection apply 6 to 8 ozs. of BAYLETON 50% DF per acre. Leaf blotch: BAYLETON 50% DF, applied at first sign of infection, will suppress light to moderate leaf blotch infections. For control of severe leaf blotch infections it is recommended that a registered fungicide with good activity against this disease be tank mixed with BAYLETON. Barkey scale: Apply 4 to 8 ozs. of BAYLETON 50% DF at the first sign of scald symptoms.
ASSES OWN FOR D adagrass adagrass agrass	Rusts (Puccinia spp.)	PREVENTATIVE RATE 4 to 8 ozs. per scre	Apply specified dosage in 20 gailons of water or more per acre with ground sprayers, or in 7 or more gailons of water per acre with sircraft. Thorough coverage is important for optimum disease control. Disease control may be enhanced by the addition of a wetting agent to spray mixtures of BAYLETON 50% DF. A maximum of 2 lbs. of BAYLETON 50% DF may be applied per acre per year. The last application may be made up to 5 days before harvest. Chaff and straw from treated area may be used for feed purposes; however, do not forage or cut green crop or use seed for feed purposes. Regrowth may be grazed 11 weeks after last application.
ed la creation de la Company d		CURATIVE RATE 8 to 16 des. per acre	RUSTS Preventative Schedule For optimum disease control, apply specified dosage of BAYLETON 50% DF as soon as weather conditions are favorable for rust development. Apply before rust pustules are present, and continue applications at 14 to 21 day intervals depending on disease pressure. Carative Schedule Apply the specified dosage if rust pustules are already present. A second application 14 to 21 days later may be necessary. On highly susceptible grass varieties and/or under prolonged conditions favorable for disease development use rates of 12 to 16 ozs. per acre and a shorter interval between applications. Rust control is especially important during the period from early head emergence through last flowering. Disease control may not be adequate and yield loss may occur if rust infection is allowed to reach 5 percent or greater before treating. BAYLETON 50% DF will prevent young, developing pustules from producing spores. However, pustules and other symptoms caused by the rust fungus prior to the application of BAYLETON 50% DF will remain visible.
	Powdery mildew	2 to 4 ozs. per acre	POWDERY MILDEW: One or two applications at the 2 to 4 ozs. rate applied at the first signs of disease and when new powdery mildew symptoms reappear are generally sufficient for disease control. In cases where severe mildew infections are present, use the higher rate.
edings)	Pine rust (Pusiform rust)	4 to 16 ozs.	Begin application prior to infection period and repeat as necessary at 2 to 3 week intervals depending upon disease pressure. Use lower rates in areas of low disease incidence and higher rates in areas of severe disease incidence. A maximum of 64 oza. of BAYLETON 50% DF may be applied per acre per season. A spreader-sticker is needed to help adhere spray solution to the pine trees.
and exertes) expr somia)	Fusiform rust (Cronartium quercuum)	20 ounces	Mix specified dosage in 100 gals. of water. Cover seeds with the mixture and soak them, at room temperature (75T), for 24 hours, stirring occasionally. Seed stratification, if necessary, should be completed before treatment with BAYLETON 30% Dry Flowable. Thoroughly air dry all seed before applying any additional treatment or before planting. A spreader sticker may be needed to help adhere BAYLETON to the pine seed. Do not use treated seed for food or feed purposes.
		2 ounces	Apply specified dosage to 50 lbs. of thoroughly wetted pine seeds in a commercial treater or other suitable tumbler apparatus. Allow to mix for at least 10 minutes before applying bird repellent or other seed dressing materials. Thoroughly air dry seed before sowing. Do not use treated seed for food or feed purposes.

po day riod tinual tay in

Rates of BAYLETON 50% Dry Flowable are based on a standard of 400 gallons of dilute spray per acre, or the equivalent amount of product per acre in a cost spray.

TANK MIXES: The following tank mix recommendations are made for the improved control of specific diseases. Before mixing BAYLETON 50% Dry Flowable with any other fungicide, read and carefully observe the

precautionary statements, directions for use, and other informaticing on the EPA registered product labels. The rates given belot thane M-45 fungicide are for the 80% wettable powder formulation

OTATIONAL CROPS

sall grains, corn, sorghum, soybeans, beans, peas, and cucurbits may be inted 35 days after the last application of BAYLETON fungicide, hower forage or vines from these crops may not be used for food or feed. oot crops may be planted 120 days after the last application but tops it not be used for food or feed. All crops may be planted 12 months or after the last application of BAYLETON without any restrictions.

EENTRY STATEMENTS

o not apply this product in such a manner as to directly or through drift ose workers or other persons. The area being treated must be vacated unprotected persons. Do not enter treated areas without protective othing until sprays have dried. Because certain states may require more trictive re-entry intervals for various crops treated with this product. asult your State Department of Agriculture for further information.

fritten or oral warnings must be given to workers who are expected to be a treated area or in an area about to be treated with this product. Oral mings should include those statements found under the label heading recautionary Statements" and "Re-entry Statements" included on the el. When oral warnings are given, warnings shall be given in a language tomarily understood by workers. Oral warnings must be given if there reason to believe that written warnings cannot be understood by work-Written warnings must include the following information: WARN-G, area treated with BAYLETON 50% Dry Flowable on (date of appliion). Do not enter without appropriate protective clothing until sprays edried. If on skin, remove contaminated clothing and wash skin immelely with soap and warm water. If eyes are contaminated, wash with ng water for at least 15 minutes. If swallowed, vomiting should be siced. (See Precautionary Statements on label).

ECAUTIONARY STATEMENTS

ZARDS TO HUMANS AND DOMESTIC ANIMALS

ARNING

parful if swallowed, inhaled, or absorbed through the skin. Causes eye lation. Do not breathe dust or allow to get in eyes, on skin, or on cloth-

th hands, arms and face thoroughly with soap and warm water after and before eating or smoking. Wash all contaminated clothing with and hot water before reuse. Do not contaminate feed or food items. out of reach of children.

ATEMENT OF PRACTICAL TREATMENT

wallowed, vomiting should be induced. Administer water freely and ace vomiting by giving one dose (1/2 oz. of 15 ml.) of syrup of ipecac. If iting does not occur within 10 to 20 minutes, administer second dose. grup of ipecac is not available, induce vomiting by sticking finger down at. Repeat until vomit fluid is clear. Never give anything by mouth to aconscious person. Professional medical assistance should be secured

skin, wash skin immediately with soap and water.

re are contaminated, wash with plenty of water for at least 15 min-Get medical attention.

haled, remove to fresh air. If not breathing, give artificial respiration, erably mouth to mouth. Get medical attention.

MPTOMS OF POISONING: The compound does not cause any defisymptoms that would be diagnostic. Poisoning is accompanied by eractivity followed by sedation.

TE TO PHYSICIAN: No specific antidote. Treat symptomatically.

NVIRONMENTAL HAZARDS

act use on other crops grown for food or forage. Keep out of lakes, and ponds. Do not contaminate water by cleaning of equipment sposal of wastes. Apply this product only as specified on the label.

nake applications when weather conditions favor drift from target

ORAGE AND DISPOSAL

kide Disposal: Do not contaminate water, food or feed by storage or Wastes resulting from the use of this product may be disposed of e or at an approved waste disposal facility.

Container Disposal: Completely empty carton into application equipment. Then dispose of empty carton in a sanitary landfill or by incineration, or if allowed by State and local authorities, by burning. If burned, stay out of

Store in a cool, dry place and in such a manner as to prevent cross contamination with other pesticides, fertilizers, food, and feed. Store in original container and out of the reach of children, preferably in a locked stor-

Handle and open container in a manner as to prevent spillage. If the container is leaking or material spilled for any reason or cause, carefully sweep material into a pile. Refer to Precautionary Statements on label for hazards associated with the handling of this material. Do not walk through spilled material. Dispose of pesticide as directed above. In spill or leak incidents, keep unauthorized people away. You may contact the Mobay Emergency Response Team for decontamination procedure or any other assistance that may be necessary. The Mobay Kansas City Emergency Response Telephone No. is 816-242-2582, or contact Chemtrec at 800-424-9300.

BAYTHROID® 2

EMULSIFIABLE

PYRETHROID INSECTICIDE

RESTRICTED USE PESTICIDE

Toxic to Fish and Aquatic Organism

For retail sale to and use only by Certified Applicators or persons under their direct supervision and only for those uses covered by the Certified Applicator's certification.

Not for sale or distribution after March 31, 1990.

Not for use after July 31, 1990.

FOR CONTROL OF INSECT PESTS ON COTTON

ACTIVE INGREDIENT:

Cyanot 4-Huoro-3-phenoxyphenyl)methyl				
3-(2,2-dichloroethenyl)-2,2-dimethylcyclopropanecarboxylate	_	٠.		25%
INERT INGREDIENTS:	•			75%
444			•	

Contains 2 pounds Cyano(4-fluoro-3-phenoxyphenyl) methyl 3-(2,2-dichloroethenyl)-2,2-dimethylcyclopropanecarboxylate per gallon.

EPA Reg. No. 3125-351

EPA Est. 3125-MO-1 U.S. Patent No. 4,218,469

BAYTHROID insecticide is a third-generation synthetic pyrethroid that represents new chemistry to the cotton pyrethroid market. It offers quick knock-down and longer residual control of both boll weevils and Heliothis species at low rates. It also controls lygus, pink boilworms, armyworms, cotton leaf perforators and loopers.

BAYTHROID is a Reg. TM of Bayer AG. Germany.

RECOMMENDED USES

Cotton.

RESTRICTIONS ON WAREHOUSE STORAGE

Store in a cool, dry place and away from open flame and extreme heat. Store in such a manner as to prevent cross contamination with other pesticides, fertilizers, food, and feed. Store in original container and out of the reach of children, preferably in a locked storage area.
