1.0 INTRODUCTION

Pursuant to a meeting with RD and EAB, the regeistrant, Rhone-Poulenc, has submittted an aerobic/anaerobic soil metabolism protocol for EAB review. In their attached letter, they affirm that

- ** Test material will be ^{14}C -labeled in the nitrophenyl ring.
- ** Soil will be representative of that from a major soybean growing area.
- ** Likely degradates will be specified.
- ** Volatiles will be collected in both aerobic and anaerobic portions of the study.

2.0 STRUCTURE and DIRECTIONS FOR USE

See previous reviews.

3.0 DISCUSSION

A copy of the proposed protocol is appended to this review. A thorough review of this protocol confirms that the test procedures to be used should generate reliable data, consistent with guidelines requirements.

4.0 CONCLUSION and RECOMMENDATION

The attached protocol is satisfactory.

Dear Mr. Mountfort:

This past Friday three of our chemists, Messrs. Tony Gemma, Frank Norris and Paul Wargo as well as myself met with Messrs. Dick Moraski, Emil Regelman and Jim Stone of the EPA in order to discuss the attached protocol. This protocol is for an aerobic/anerobic soil metabolism study to be conducted on aci-fluorfen. It is our understanding that a study conducted under this protocol would satisfy the aerobic/anaerobic soil metabolism data requirements you have noted in your letter of September 7, 1983, as long as the following four points are considered.

- the test material will be labeled in the nitrophenyl ring with carbon 14.
- a soil type representative of the major soybean growing areas will be used.
- likely degradates will be specified.
- volatiles will be collected from the anaerobic portion of the study as well as the aerobic.

We appreciate the opportunity to discuss this with Agency chemists. Your cooperation is much appreciated.

Sincerely,

RHONE-POULENC INC.
Agrochemical Division
