DATA EVALUATION REPORT

STUDY TYPE: Mutagenicity: Salmonella typhimurium/mammalian microsome
mutagenicity assay; OPPTS 870.5265 [§84-2]

DP BARCODE: D224202

SUBMISSION NO.: S501233

PC CODE: 123000

TOX. CHEM. NO.:

MRID NO: 43904814

TEST MATERIAL (PURITY): RPA 203328 (99.7%)

SYNONYM(S): 2-Methanesulphonyl-4-trifluoromethylbenzoic acid (metabolite of isoxaflutole)

CITATION: Percy, A. (1994). RPA 203328 Salmonella typhimurium Reverse Mutation Assay (Ames Test); Rhône-Poulenc - Secteur Agro Centre de Recherche, Sophia Antipolis, France; Study Report No. SA 94057; Study completion date: October 13, 1994. Unpublished MRID No. 43904814.

SPONSOR: Rhône-Poulenc, Lyon, France

CONCLUSIONS--EXECUTIVE SUMMARY: In two independent microbial gene mutation assays (MRID No. 43904814), Salmonella typhimurium strains TA1535, TA1537, TA98, and TA100 were exposed to 100, 250, 500, 1000, 2500 or 5000 µg/plate RPA 203328 (99.7%) in the absence or presence of S9 activation. The S9 fraction was derived from Aroclor 1254-induced rat livers and the test material was delivered to the test system in dimethyl sulfoxide.

Cytotoxicity (i.e., generally observed as an extreme thinning of the background lawn of growth) was seen at levels ≥ 2500 µg/plate +/- S9. All strains responded to the mutagenic action of the appropriate positive control. There was, however, no evidence that RPA 203328 induced a mutagenic response in either trial.

The study is classified as Acceptable and satisfies the guideline requirement for a microbial gene mutation assay (84-2).

COMPLIANCE: Signed and dated GLP, Quality Assurance and Data Confidentiality statements were provided.

August 27, 1996

A. MATERIALS:1. Test Material: RPA 203328

Description: White powder

Lot/batch number: DA938

Purity: 99.7% (see section E., Study Deficiencies for comment on purity)

Receipt date: Not listed

Stability: Not provided

CAS number: Not listed

Structure:

Solvent used: Dimethyl sulfoxide (DMSO)

Other comments: The test material was stored at room temperature, protected from light. Dosing solutions were prepared immediately prior to use; actual concentrations were not verified analytically.

2. Control Materials:

Negative: None

Solvent/final concentration: DMSO--0.1 mL/plate

Positive: Nonactivation:

Sodium azide 1 µg/plate TA100, TA15352-Nitrofluorene 1 µg/plate TA989-Aminoacridine 50 µg/plate TA1537

Other:

Activation:

2-Aminoanthracene 2 µg/plate all strains including3. Activation: S9 derived from Fischer 344 male

<u>x</u> Aroclor 1254	<u>x</u> induced	<u>x</u> rat	<u>x</u> liver
<u> </u> phenobarbital	<u> </u> noninduced	<u> </u> mouse	<u> </u> lung
<u> </u> none		<u> </u> hamster	<u> </u> other
<u> </u> other		<u> </u> other	

The rat liver homogenate (Batch No. FLI074) was supplied by Inveresk Research International, UK. The composition of the S9-cofactor mix was as follows:

<u>Component</u>	<u>Concentration</u>
Sodium phosphate buffer (pH 7.4)	100 mM
Glucose-6-phosphate	5 mM
NADP	4 mM
MgCl ₂	8 mM
KCl	33 mM
S9	10%

4. Test Organism Used: S. typhimurium strains
 _____ TA97 x TA98 x TA100 _____ TA102 _____ TA104
x TA1535 x TA1537 _____ TA1538; list any others:

Test organisms were properly maintained: Yes.
 Checked for appropriate genetic markers (rfa mutation, R factor): Yes.

5. Test Compound Concentrations Used:

- (a) Preliminary cytotoxicity assay: Nine levels (1, 10, 50, 100, 250, 500, 1000, 2500 and 5000 µg/plate) were evaluated with and without S9 activation using strain TA100. Duplicate plates were prepared per dose per condition.

- (b) Mutation assays:

Initial assay: Six nonactivated and six S9-activated concentrations (100, 250, 500, 1000, 2500 and 5000 µg/plate) were evaluated using all tester strains. Triplicate plates were prepared per dose per strain per condition.

Confirmatory assay: As above for the initial mutation assay.

B. TEST PERFORMANCE:

1. Type of Salmonella Assay: x Standard plate test
 _____ Pre-incubation (____) minutes
 _____ "Prival" modification
 _____ Spot test
 _____ Other (described).

Preliminary Cytotoxicity/ Mutation Assays: Similar procedures were used for the preliminary cytotoxicity and the mutation assays. To prepared tubes containing 2.5 mL of molten top agar, 0.1 mL of a 10-hour broth culture (1-10x10⁹ cells/mL) of the appropriate tester strain and 0.1 mL of the appropriate test material dose, solvent, or positive control were added. For the S9-activated phase of testing, the agar volume was reduced to 2.0 ml and 0.5 ml of the S9-cofactor mix were added. The contents of

RPA 203328

SALMONELLA [84-2]

each tube were mixed, poured over minimal-glucose medium, and incubated at 37°C for ~72 hours. As part of each mutation test, the viability and genetic characteristics of each strain were verified. Sterility checks were also performed on the S9-cofactor mix and the highest test material solution. At the end of incubation, the background lawn of growth was examined and revertant colonies were counted. Means and standard deviations were calculated for the mutation assays.

2. Evaluation criteria:

Assay validity: The assay was considered valid if the following criteria were met: (1) The S9-cofactor mix and highest test material dosing solution were sterile; (2) the presence of the appropriate genetic markers was verified for each strain; (3) bacterial suspensions contained 10^9 - 10^{10} viable cells/mL; (4) the number of spontaneous revertants of each strain fell within the reporting laboratory's provided acceptable ranges; and (5) the number of histidine revertants (his⁺) induced by the positive controls were within the expected ranges of the reporting laboratory.

Positive response: The test material was considered positive if it caused a reproducible and dose-related ≥ 2 -fold increase in revertant colonies of any strain.

C. REPORTED RESULTS:

1. Preliminary Cytotoxicity Assay: Levels of 1 to 5000 $\mu\text{g}/\text{plate}$ +/-S9 were evaluated for cytotoxic effects on strain TA100. No revertant colonies were seen at nonactivated 5000 $\mu\text{g}/\text{plate}$ and minimal cytotoxicity (i.e., slight to moderate thinning of the background lawn of growth) was noted at 5000 $\mu\text{g}/\text{plate}$ +S9 and at 2500 $\mu\text{g}/\text{plate}$ -S9. Based on these findings, six test material doses ranging from 100 to 5000 $\mu\text{g}/\text{plate}$ +/-S9 were selected for further investigation.
2. Mutation Assays: Representative results from the initial and confirmatory trials with RPA 203328 are presented in Tables 1 and 2, respectively. As shown, data from both trials were in good agreement and indicated that test material levels ≥ 2500 $\mu\text{g}/\text{plate}$ with or without S9 activation were cytotoxic to all strains as indicated by effects on the background lawn of growth or by reductions in revertant colonies. There was, however, no indication of a mutagenic effect at any assayed concentration. By contrast to the negative results with the test material, all strains responded in the expected manner to the appropriate nonactivated or S9-activated positive controls in both trials.

Based on the overall results, the study author concluded that RPA 203328 was negative in this microbial test system.

- D. REVIEWERS' DISCUSSION/CONCLUSIONS: We assess that the mutation assays were properly conducted and that the study author interpreted the data correctly. RPA 203328 was tested to the highest concentration recommended for microbial assays (5000 $\mu\text{g}/\text{plate}$) and was cytotoxic at doses $\geq 2500 \mu\text{g}/\text{plate}$ +/-S9 but failed to induce a mutagenic response in two independently performed trials. The response of all strains to the appropriate nonactivated and S9-activated positive controls demonstrated the sensitivity of the test system to detect mutagenesis. We concluded, therefore, that the study provided acceptable evidence that RPA 203328 was negative in this microbial gene mutation assay.
- E. STUDY DEFICIENCIES: Test material purity was listed as 99.7% on Report Summary p. 9 and on the Certificate of Analysis, Study Report p. 44. We, therefore, assume that the purity listed on Study Report p. 11 (97.7%) was an error. This discrepancy did not affect the outcome of the study.

TABLE 1. Representative Results of the Initial *Salmonella typhimurium* Mutagenicity Assay with RPA 203328

Substance	Acti- vation	Dose per plate	Revertants per Plate of Bacterial Tester Strains ^a			
			TA1535	TA1537	TA98	TA100
