7. **CONCLUSIONS:** This study is scientifically sound and fulfills the guideline requirements for an avian reproduction study. There were no treatment-related effects observed when mallard ducks were fed M&B 46030 technical for 23 weeks at 100, 500, and 1000 ppm a.i. The no-observed-effect concentration (NOEC) was 1000 ppm a.i. (nominal concentration).

8. **RECOMMENDATIONS:** N/A.

9. **BACKGROUND:**

10. **DISCUSSION OF INDIVIDUAL TESTS:** N/A.

11. **MATERIALS AND METHODS:**

A. **Test Animals:** Mallard ducks (*Anas platyrhynchos*) were purchased from a commercial supplier in Hanover,

38.0 A.S

2

Illinois. The birds were 18 weeks of age at study initiation and were acclimated to the laboratory environment for 21 days. All birds were phenotypically indistinguishable from wild birds. At test initiation, all birds were examined for physical injuries and general health.

B. **Dose/Diet Preparation/Food Consumption:** Diets were prepared by mixing a standard premix with stock diet. The standard premix was a mixture of the appropriate amount of test substance, acetone, and stock diet. Diets were prepared fresh weekly, approximately 24 hours prior to administration. The control diet consisted of stock diet and acetone in the amount equivalent to the treatment diets. Test diets were adjusted to 100% active ingredient. Each of the three treatment groups and the control birds were fed the appropriate diet for 23 weeks.

Basal diet for adult birds during the study was Purina® Game Bird Breeder Layena®. The composition of this diet was presented in the report. The test substance was not mixed into the diet of the offspring. Food and water were supplied *ad libitum* during acclimation and during the test, except in the control group during weeks 6 and 7 when water was withheld for two 24-hour periods in an effort to halt premature egg production.

Verification samples of control and treated diets were collected during test weeks 1, 2, 3, 4, 8, 12, 16, and 20 and frozen. Samples were shipped under dry ice to Hazleton Laboratories America, Inc. for analysis using high performance liquid chromatography (HPLC). Stability of the test material was determined during a pilot study (BLAL Study No. 108-007-06).

C. **Design:** The birds were randomly distributed into four groups as follows:

M&B 46030 Technical Nominal Concentration	Number of Pens	Birds Per Pen	
		Males	Females
Control (0 ppm a.i.)	16	1	1
100 ppm a.i.	16	1	1
500 ppm a.i.	16	1	1
1000 ppm a.i.	16	1	1

Treatment levels were based upon the results of a 28-day dietary pilot study. Adult birds were identified by individual leg bands.

3

D. **Pen Facilities:** Adult birds were housed in wire pens which measured 61.0 x 121.9 x 61.0 cm. The average daily temperature in the adult study room was 19°C, with an average relative humidity of 78%.

The photoperiod during the first 8 weeks of the study was 7 hours of light per day. The photoperiod was then increased to 17 hours of light per day at the beginning of week 9. This level was maintained for the duration of the study.

E. **Adult Observations/Gross Pathology:** Adult birds were observed daily throughout the study for signs of toxicity. Mortalities and their surviving pen mates were necropsied. Necropsies were also conducted on half of all surviving adult birds from each group at termination of the study. Adult body weights were measured at study initiation, biweekly through week 8, and at study termination. Adult feed consumption was measured biweekly throughout the study.

F. **Eggs/Eggshell Thickness:** Eggs were collected and candled daily during the production period. All eggs were labeled according to pen of origin. Normal eggs were stored at average daily minimum and maximum temperatures of 18 and 20°C, respectively, and relative humidity of 74%. The eggs were turned once daily during each seven-day collection period. Eggs were removed from the egg cooler weekly and eggs not cracked or used for eggshell thickness measurements were placed in incubators maintained at approximately 37 to 38°C with the average relative humidity ranging from 61 to 68%. All eggs were turned automatically every two hours while in the incubator. Eggs were candled on day 14 of incubation to determine fertility and on day 21 to determine embryo survival. On incubation day 23, the eggs were placed in hatching trays.

Eggs were collected on the first day of nine separate intervals of the test period for eggshell thickness measurements. Eggs used for eggshell thickness were opened, the contents removed, thoroughly washed, air dried for at least 48 hours, and the average thickness determined by measuring three points around the equator of the egg. Measurements were recorded to the nearest 0.01 mm. The egg shells and contents were frozen for residue analysis, if requested by the sponsor.

G. **Hatchlings:** The hatchlings were divided by group and pen number and housed in a building separate from their

4

parents. All hatchlings were observed daily and received untreated diet during the 14-day observation period. The hatchlings were maintained at average minimum and maximum temperatures ranging from 25-34°C and average relative humidity ranging from 60-94%. Hatchling body weights were measured and recorded at hatch and on day 14. Feed consumption was not measured.

Gross pathological examinations were conducted on hatchlings found dead during the 14-day observation period and on selected hatchlings on day 14.

H. **Statistics:** ~~For parametric procedures (i.e., adult~~ body weights, feed consumption, eggshell thickness, and hatchling body weights on day 1 and day 14), a Levene's test was first conducted to determine whether the variances across the groups were homogenous (at the 0.01 level of significance). If there was not a significant difference in the group variances, a parametric one-way analysis of variance was conducted along with a Dunnett's test. If there was a significant inequality of variance, a nonparametric one-tailed Dunnett's test was performed.

A Levene's test was conducted to determine whether the variances across the groups were homogenous (at the 0.01 level of significance) for the count variables, the ratio variables, and the arcsine transformation of the ratio variables. If there was not a significant difference in the group variances, a parametric one-way analysis of variance was conducted along with a Dunnett's test.

If there was a significant inequality of variance for a count variable, a nonparametric analysis of variance was conducted. If there was a significant inequality of variance for a ratio variable, the parametric analysis of its arcsine transformation was performed if the arcsine transformation resulted in group variances which were not significantly different.

If the arcsine transformation did not remedy an inequality of variance problem with a ratio variable, then a nonparametric one-tailed Dunnett's test was conducted on the ratio variable.

12. **REPORTED RESULTS:**

A. **Diet Analysis:** The percent of nominal recovered from the diets prepared during test weeks 1, 2, 3, 4, 8, 12, 16, and 20 averaged 92.1, 96.2, and 100.5% for the 100, 500, and 1000 ppm a.i. test diets, respectively (Table 1, attached).

Homogeneity and stability were tested on diet samples used in a pilot study (BLAL Study No. 108-007-06). The results of those analyses (included in Appendix 8) show that the test material was stable and homogeneously mixed during the pilot study.

B. **Mortality and Behavioral Reactions:** Two birds (one female in the control group and one male at 1000 ppm a.i.) died during the study. No other adult mortalities were recorded during the study. No clinical signs of toxicity were noted in any of the birds during the investigation.

Post-mortem examinations of the two birds that died during the study and their pen mates showed no treatment-related effects. Examinations of one-half of the surviving adult birds in each group revealed no treatment-related findings.

C. **Adult Body Weight and Food Consumption:** There were no significant differences in body weights noted during the study. Small differences (increases or decreases) in mean body weights were considered to be random occurrences.

A significant difference in feed consumption (lower value) was noted at 1000 ppm a.i. during the first interval (weeks 1 and 2) only. This was not considered to be treatment-related because it occurred during only 1 of 12 intervals. This finding may have been due to a lack of palatability (Tables 2A and 2B, attached).

D. **Reproduction:** There were no significant differences in any reproductive parameter when compared with the control (Tables 4A and 4B, attached).

E. **Eggshell Thickness:** There were no significant differences in eggshell thickness when compared with the control (Table 6A, attached).

F. **Offspring:** There were no significant differences in body weights noted on days 1 or 14 when mean values from all pens were analyzed. There were no significant

differences noted with respect to the numbers of 14-day-old survivors of ducklings hatched during the study (Tables 7 and 8, attached).

There were no treatment-related signs of toxicity or abnormal behavior in any test group. There were no treatment-related findings from the *post-mortem* examinations of the hatchlings that died during the study or on selected day 14 hatchlings.

13. **STUDY AUTHOR'S CONCLUSIONS/QUALITY ASSURANCE MEASURES:** "The ingestion of M&B 46030 Technical by the parental generation at levels of 100, 500 and 1,000 ppm a.i. did not adversely affect the reproductive success of the F_0 generation or the survivability and development of the offspring in the F_1 generation.

"The no-observed-effect level was considered to be 1,000 ppm a.i., the highest concentration tested."

The report stated that the study was conducted in conformance with Good Laboratory Practice (GLP) regulations (40 CFR Part 160). There were four minor protocol deviations but these should not have affected the outcome of the study. Quality assurance audits were conducted during the study and the final report was signed by a Quality Assurance Officer for Bio-Life Associates, Ltd. An additional statement of conformance with GLP (40 CFR part 160) guidelines was included in the analytical report.

14. **REVIEWER'S DISCUSSION AND INTERPRETATION OF STUDY RESULTS:**

A. **Test Procedure:** The test procedures were in accordance with Subdivision E, ASTM, and SEP guidelines except for the following deviations:

The homogeneity and stability of the test material in the test diets was not verified. Instead, homogeneity and stability were analyzed in diets used in a pilot study.

The daily temperature and average relative humidity were 19°C and 78% in the adult study room; 21°C and 55% are recommended.

The SEP recommends that eggs be stored at a temperature of 16°C and a relative humidity of 65%; eggs were stored between 18 and 20°C (average daily minimum and maximum temperature) and 74%.

7

Test levels were not separated by a factor of five.

B. **Statistical Analysis:** Statistical analyses of reproductive parameters were performed by the reviewer using analysis of variance (ANOVA) following arcsine square-root transformation of the ratio data. The comparisons between control data and data from each treatment level were made using Dunnett's procedure and Bonferroni's procedure. The computer program is based on the EEB Birdall program. The significance level was $p \leq 0.05$.

The results of the reviewer's analyses (printouts attached) were in general agreement with those reported by the authors.

C. **Discussion/Results:** This study is scientifically sound and fulfills the guideline requirements for an avian reproduction study. There were no treatment-related effects observed when mallard ducks were fed M&B 46030 technical for 23 weeks at 100, 500, and 1000 ppm a.i. The NOEC was 1000 ppm a.i. (nominal concentration).

D. **Adequacy of the Study:**

(1) **Classification:** Core.

(2) **Rationale:** N/A.

(3) **Repairability:** N/A.

15. **COMPLETION OF ONE-LINER:** Yes; 02/04/94.

General Linear Models Procedure

Dunnett's T tests for variable: POSTF

NOTE: This tests controls the type I experimentwise error for comparisons of all treatments against a control.

Alpha= 0.05 Confidence= 0.95 df= 52 MSE= 12107.69
Critical Value of Dunnett's T= 2.419

Comparisons significant at the 0.05 level are indicated by '***'.

TRT Comparison	Simultaneous Lower Confidence Limit	Difference Between Means	Simultaneous Upper Confidence Limit
C - A	-44.83	52.57	149.97
B - A	-76.45	24.14	124.74
D - A	-112.86	-10.35	92.16

General Linear Models Procedure

Duncan's Multiple Range Test for variable: POSTF

NOTE: This test controls the type I comparisonwise error rate, not the experimentwise error rate

Alpha= 0.05 df= 52 MSE= 12107.69
WARNING: Cell sizes are not equal.
Harmonic Mean of cell sizes= 14.17032

Number of Means 2 3 4
Critical Range 82.99 87.26 90.09

Means with the same letter are not significantly different.

General Linear Models Procedure

Bonferroni (Dunn) T tests for variable: POSTF

NOTE: This test controls the type I experimentwise error rate but generally has a higher type II error rate than Tukey's for all pairwise comparisons.

Alpha= 0.05 Confidence= 0.95 df= 52 MSE= 12107.69
Critical Value of T= 2.74295

Comparisons significant at the 0.05 level are indicated by '***'.
