7. **CONCLUSIONS:** This study is scientifically sound but does
not fulfill the requirements for an avian reproduction
study. There were no treatment-related effects observed in
bobwhite quail that were fed M&B 46030 for 20 weeks and 2
days at 0.2, 2, and 10 ppm a.i. (nominal concentrations).
The no-observed-effect concentration (NOEC) was 10 ppm a.i.
8. **RECOMMENDATIONS:** N/A.
9. **BACKGROUND:**
10. **DISCUSSION OF INDIVIDUAL TESTS:** N/A.
11. **MATERIALS AND METHODS:**

A. **Test Animals:** The birds used in this study were
bobwhite quail (*Colinus virginianus*) purchased from a

10. **DISCUSSION OF INDIVIDUAL TESTS:** N/A.

commercial supplier in Gravette, AR. The birds were 26 weeks of age at study initiation and were acclimated to the laboratory environment for 29 days. All birds were phenotypically indistinguishable from wild birds. At test initiation, all birds were examined for physical injuries and general health.

- B. Dose/Diet Preparation/Food Consumption:** Diets were prepared by mixing a standard premix with stock diet. The standard premix was a mixture of the appropriate amount of test substance dissolved in acetone and added to stock diet. Diets were prepared fresh weekly, approximately 24 hours prior to administration. The control diet consisted of stock diet and acetone in the amount equivalent to the test diets. The diets were adjusted to 100 percent active ingredient and are reported as parts per million (ppm) of active ingredient (a.i.). Each of the three treatment groups and the control group were fed the appropriate diet for 20 weeks and 2 days.

Basal diet for adult birds during the first 4 weeks of the study was Purina® Duck Grower W/O®. The birds received Purina® Game Bird Breeder Layena® from week 5 until study termination. The compositions of these diets were presented in the report. The test substance was not mixed into the diet of the offspring. Food and water were supplied *ad libitum* during acclimation and during the test.

Samples of approximately 100 g were collected during test weeks 1, 2, 3, 4, 8, 12, 16, and 20. These samples were immediately frozen after collection and were shipped, under dry ice, to Hazleton, Wisconsin, for concentration verification using gas chromatography.

- C. Design:** The birds were randomly distributed into four groups as follows:

M&B 46030 Technical Nominal Concentration	Number of Pens	Birds Per Pen	
		Males	Females
Control (0 ppm a.i.)	12	1	2
0.2 ppm a.i.	12	1	2
2 ppm a.i.	12	1	2
10 ppm a.i.	12	1	2

Treatment levels were based upon results of a 28-day dietary pilot study. Adult birds were identified by individual wing tags.

- D. **Pen Facilities:** Adult birds were housed in steel wire pens which measured 53.3 x 61.0 x 38.1 cm. The average daily temperature in the adult study room was 25°C with an average relative humidity of 56%.

The photoperiod during the first 7 weeks of the study was 7 hours of light per day. At the start of week 8, the photoperiod was increased to 17 hours of light per day and maintained at that level for the duration of the study.

- E. **Adult Observations/Gross Pathology:** Adult birds were observed daily throughout the study for signs of toxicity. Mortalities occurring prior to terminal adult sacrifice were recorded and necropsied. Necropsies were also conducted on half of all surviving adult birds from each concentration at study termination. Adult body weights were measured at study initiation, biweekly through week 8, and at study termination. Feed consumption was measured in each cage biweekly during the treatment period.

- F. **Eggs/Eggshell Thickness:** Eggs were collected daily during the production period and were labeled according to pen of origin. Normal eggs were stored at 16 and 19°C (average daily minimum and maximum temperature) with an average relative humidity of 76%. The eggs were turned once daily during each seven-day collection period. Eggs were removed from the egg cooler weekly and eggs not cracked or used for eggshell thickness measurements were placed in incubators maintained at 37.7°C with relative humidity ranging from 58-67%. All eggs were turned automatically every four hours while in the incubator. Eggs were candled on day 11 of incubation to determine fertility and on day 18 to determine embryo survival. On incubation day 21, the eggs were placed in hatching trays.

Eggs were collected on the first day of six separate intervals of the test period for eggshell thickness measurements. Eggs were broken, the contents removed, thoroughly washed, air dried for at least 48 hours, and measured at three points around the equator of the egg. The egg shells and contents of the eggs were frozen for residue analysis, if requested by the Sponsor.

- G. **Hatchlings:** Hatchlings were housed according to group and pen number. All hatchlings were observed daily and received untreated diet during the 14-day observation period. The hatchlings were maintained at average

minimum and maximum temperatures ranging from 35 to 47°C and average relative humidity ranging from 39 to 52%. Hatchling body weights were measured and recorded at hatch and on day 14.

Gross pathological examinations were conducted on birds found dead during the 14-day observation period and on selected hatchlings on day 14.

- H. **Statistics:** Analysis of variance (ANOVA) was used to statistically analyze the following parameters:

Adult Body Weight	Hatchling Body Weight
Adult Feed Consumption	Eggshell Thickness

Contingency Table Analysis was used to statistically analyze the following parameters:

Eggs Set of Eggs Laid	Eggs Laid Per Hen
One Week Eggs of Fertile Eggs Set	Midterm Eggs of Fertile Eggs Set
Full-Term Eggs of Fertile Eggs Set	Cracked Eggs of Eggs Laid
Infertile Eggs of Eggs Set	Live 3-Week Embryos of Fertile Eggs Set
Hatched Eggs of Fertile Eggs Set	14-Day Old Survivors of Hatchlings
Fertile Eggs of Eggs Set	Normal Eggs of Eggs Laid
Defective Eggs of Eggs Laid	

12. **REPORTED RESULTS:**

- A. **Diet Analysis:** The percent recoveries for the diets prepared during test weeks 1, 2, 3, 4, 8, 12, 16, and 20 averaged 88.1, 89.0, and 92.2% for the 0.2, 2, and 10 ppm a.i. test groups, respectively (Table 1, attached).
- B. **Mortality and Behavioral Reactions:** Mortality in the control and at 0.2, 2, and 10 ppm a.i. was 8.3, 5.6, 16.7, and 8.3%, respectively. The deaths were attributed to factors other than the test material and examinations of one-half of the surviving adult birds revealed no treatment-related effects.
- C. **Adult Body Weight and Food Consumption:** No significant differences in body weights were noted throughout the study. Small differences (increases or decreases) in mean body weights were considered to be random

occurrences which were unrelated to the test material. No significant differences in feed consumption were noted throughout the study. Occasional small differences were not statistically significant (Tables 2A and 2B, attached).

- D. **Reproduction:** When compared to controls, there was a significantly higher number of cracked eggs at 0.2 and 2 ppm a.i. These differences were not considered to be treatment-related because the 10 ppm a.i. test group was unaffected (Tables 4A and 4B, attached). The ingestion of the test material had no adverse affects on egg fertility, hatchability, or survival of newly hatched quail.
- E. **Eggshell Thickness:** There were no significant differences in eggshell thickness when compared to control eggs (Table 6A, attached).
- F. **Offspring:** Although some significant differences in body weights were noted for various groups within the hatches, these intergroup differences were not consistent or dose correlated. Hence, these differences were not considered to be treatment-related (Tables 8 and 9, attached).

Twelve hatchlings in various groups died after their pens became wet from leaky waterers, or after they had been playing in the waterers, or after their waterers leaked dry. There were no significant differences noted in hatchling survival.

There were no treatment-related abnormal behavioral reactions or clinical signs of toxicity noted in any hatch. Gross pathological examinations of hatchlings found dead or of selected hatchlings on day 14 revealed no treatment-related findings.

13. **STUDY AUTHOR'S CONCLUSIONS/QUALITY ASSURANCE MEASURES:**

"The ingestion of M&B 46030 Technical by the parental generation did not adversely affect the reproductive success of the F₀ generation or the viability of the offspring in the F₁ generation. The no-observed-effect level was determined to be 10 ppm a.i."

The report stated that the study was conducted in conformance with Good Laboratory Practice (GLP) regulations (40 CFR Part 160). Quality assurance audits were conducted during the study and the final report was signed by a

Quality Assurance Officer for Bio-Life Associates, Ltd. An additional statement of conformance with GLP (40 CFR part 160) guidelines was included in the analytical report.

14. REVIEWER'S DISCUSSION AND INTERPRETATION OF STUDY RESULTS:

- A. Test Procedure:** The test procedures were in accordance with Subdivision E, ASTM, and SEP guidelines except for the following deviations:

The homogeneity and stability of the test material in the diets were not confirmed by chemical analysis.

The average daily temperature in the adult study room was 25°C; 21°C is recommended.

The SEP recommends that eggs be stored at a temperature of 16°C and a relative humidity of 65%; eggs were stored with average daily minimum and maximum temperatures of 16 to 19°C with a relative humidity of 76%.

The SEP recommends that eggs be hatched at a temperature of 39°C and a relative humidity of 70%; eggs were hatched at 37.7°C and relative humidity ranging from 58-67%.

Test treatments were not of a high enough concentration to generate an effect level.

Test treatments were not separated by a factor of five.

Test treatments did not overlap the expected environmental concentration.

- B. Statistical Analysis:** Statistical analyses of reproductive parameters were performed by the reviewer using analysis of variance (ANOVA) following arcsine square-root transformation of the ratio data. The comparisons between control data and data from each treatment level were made using Dunnett's procedure and Bonferroni's procedure. The computer program is based on the EEB Birdall program. The significance level was $p \leq 0.05$.

The results of the statistical analyses were similar to those reported by the author with the following exception (see attached printouts): male body weight at 0.2 and 2 ppm a.i. was significantly lower when compared with the control using Dunnett's test. This

effect was not observed at 10 ppm a.i. and therefore is not considered to be treatment-related.

- C. **Discussion/Results:** Excoriation developed in a total of 58 birds. The author stated that the affected birds "...did not exhibit any abnormal behavioral reactions other than slightly restricted mobility of the affected region, lethargy, and weight loss." However, weight loss in breeding birds (especially females) can have major effects on reproduction. It is unclear whether excoriation affected reproduction or contributed to the observed mortality. The authors attributed the excoriation to increased activity and additional stress during the 17-hour photoperiod. However, the reviewer notes that this testing laboratory routinely reports this condition in bobwhite quail studies, while other testing laboratories do not seem to have this problem. Husbandry techniques may be responsible for the frequency of excoriation observed in studies conducted by this laboratory. While excoriation does not appear to have affected the outcome of this study, the results may not be directly comparable with results of other studies that did not have a high rate of excoriation.

The maximum application rate of Fipronil 1.5G is 0.13 lbs. a.i./A. The maximum expected residues, based on Hoerger and Kenega, with 1 lb a.i./A is 240ppm (based on short grasses). Multiplying the maximum application rate of Fipronil 1.5G (0.13 lbs a.i./A) by the Kenega value (240ppm) would indicate an estimated environmental concentration (EEC) of 31 ppm a.i./A. Test concentrations should include an actual or expected field residue exposure level and a multiple level such as five. The range selected must generate an LOEC as well as NOEC without causing any mortalities in the parent generation. The highest concentration that was tested was 10ppm (nominal) which is lower than the estimated environmental concentration of 31 ppm ai/A.

This study is scientifically sound but does not fulfill the requirements for an avian reproduction study. There were no treatment-related effects observed in bobwhite quail that were fed M&B 46030 for 20 weeks and 2 days at 0.2, 2, and 10 ppm a.i. The NOEC was 10 ppm a.i.

- D. **Adequacy of the Study:**

(1) **Classification:** Supplemental.

(2) **Rationale:** This study must be repeated so that the test concentrations include the estimated environmental concentration (EEC = 31ppm) for Fipronil 1.5G. The range selected must generate an LOEC as well as NOEC without causing any mortalities in the parent generation.

(3) **Repairability:** Irreparable.

15. **COMPLETION OF ONE-LINER:** Yes; 01/28/94.

NOTE: To ensure overall protection level, only probabilities associated with pre-planned comparisons should be used.

21. COVARIATE ANALYSIS OF MALE BODY WEIGHT DATA

10:25 Tuesday, March 29, 1994

General Linear Models Procedure

Duncan's Multiple Range Test for variable: POSTM

NOTE: This test controls the type I comparisonwise error rate, not the experimentwise error rate

Alpha= 0.05 df= 54 MSE= 13244.68
WARNING: Cell sizes are not equal.
Harmonic Mean of cell sizes= 14.7046

Number of Means 2 3 4
Critical Range 85.14 89.52 92.42

Means with the same letter are not significantly different.

Duncan Grouping	Mean	N	TRT
A	1196.20	15	B
A	1192.00	14	A
A	1156.29	14	D
A	1135.25	16	C

21. COVARIATE ANALYSIS OF MALE BODY WEIGHT DATA

10:25 Tuesday, March 29, 1994

General Linear Models Procedure

Dunnnett's T tests for variable: POSTM

NOTE: This tests controls the type I experimentwise error for comparisons of all treatments against a control.

Alpha= 0.05 Confidence= 0.95 df= 54 MSE= 13244.68
Critical Value of Dunnnett's T= 2.413

Comparisons significant at the 0.05 level are indicated by '***'.

TRT	Simultaneous Lower Confidence Limit	Difference Between Means	Simultaneous Upper Confidence Limit
B - A	-99.01	4.20	107.41
D - A	-140.69	-35.71	69.26

21. COVARIATE ANALYSIS OF MALE BODY WEIGHT DATA

10:25 Tuesday, March 29, 1994

General Linear Models Procedure

Bonferroni (Dunn) T tests for variable: POSTM

NOTE: This test controls the type I experimentwise error rate but generally has a higher type II error rate than Tukey's for all pairwise comparisons.

Alpha= 0.05 Confidence= 0.95 df= 54 MSE= 13244.68
Critical Value of T= 2.73694

Comparisons significant at the 0.05 level are indicated by '***'.

TRT	Simultaneous Lower Confidence Limit	Difference Between Means	Simultaneous Upper Confidence Limit
B - A	-112.94	4.20	121.34
B - D	-77.22	39.91	157.05
B - C	-52.34	60.95	174.24
A - B	-121.34	-4.20	112.94
