3% GARDONA® Insecticide Dust is suitable for use with ground or airplane equipment. Time applications in accordance with state and federal recommendations; consult the State Agricultural Extension Service.

**USE AND DIRECTIONS FOR APPLICATION**

3% GARDONA Dust is for use on corn (sweet corn, popcorn, field corn) for the control of corn earworm.

For control of corn earworm feeding in the whorls prior to development of tassels or silks use 25 to 33 1/3 lbs/acre of 3% GARDONA Dust making application directly over the plant for maximum coverage into the whorl. Treatment should begin as soon as damaging numbers are apparent. Dust weekly or once every 3 to 4 days depending on infestation pressure from the time the plant emerges until silking.

To protect ears from earworm larvae use 25 to 50 lbs/acre 3% GARDONA Dust. Direct application at the ear zone to ensure uniform coverage of silks. Begin application on the day silks appear and continue until silks are dry and no longer attractive to moths for egg deposition. Under mid-season growing conditions and moderate to heavy infestation pressure, application intervals of 1 to 2 days may be necessary. During periods of slower growth and lighter infestation pressure, application intervals may be lengthened to 3 to 5 days. For maximum effectiveness dust application should be uniform for thorough coverage of ears and silks and timed with larvae emergence.

3% GARDONA Dust can be applied up to the day of harvest for corn grown for human consumption. Treated corn forage can be fed to cattle providing a five day interval exists between final treatment and day of feeding. Do not apply when weather conditions favor drift from areas treated.
