

EPA Reg. No. 241-295

For Control of Kochia

PM 25
241-295
PC 1011

Directions For Use

It is a violation of Federal law to use this product in a manner inconsistent with its labeling.

Observe all Precautionary Statements, Limitations, and Application Instructions on the ARSENAL 0.5 Granule package label before using. See the package label for General Information and Weeds Controlled.

A preemergence application of ARSENAL 0.5 Granule is recommended for control of most annual and perennial grasses and broadleaf weeds on noncropland areas such as railroad, utility, pipeline and highway rights-of-way, petroleum tank farms, pumping installations, fence rows, storage areas, and other similar areas. ARSENAL 0.5 Granule may be applied any time during the growing season before kochia (Kochia scoparia) has emerged.

Uniformly apply ARSENAL 0.5 Granule with properly calibrated aerial or ground equipment at a rate of 1.0 lb. ae/acre (200 pounds of product per acre).

Certain biotypes of kochia may not be adequately controlled by ARSENAL and other herbicides with the AHAS/ALS inhibiting mode of action*. If these biotypes are known or suspected on the treatment area, it is recommended that ARSENAL 0.5 Granule be used in sequence with other registered herbicides that have a different mode of action than ARSENAL.

Consult your supplier, consultant, appropriate state agricultural extension service representative or local American Cyanamid Company representative to obtain specific recommendations for sequential treatments.

*Mode of action is the process by which a chemical reacts within a plant to interrupt normal plant interactions necessary for growth and development. AHAS/ALS are plant enzymes that enable the plant to produce proteins.

This label must be in the possession of the user at the time of herbicide application.
