

FOR USE IN SOYBEANS
THIS LABEL EXPIRES APRIL 30, 1997

TRI-SCEPT followed by Classic¹ for Sicklepod Control in Soybeans

OBSERVE ALL PRECAUTIONARY STATEMENTS AND LIMITATIONS IN THE TRI-SCEPT LABEL BEFORE USING. SEE THE TRI-SCEPT LABEL FOR PRECAUTIONS, WORKER PROTECTION STANDARD REQUIREMENTS, APPLICATION INFORMATION AND USES WITH OTHER PRODUCTS.

DIRECTIONS FOR USE

It is a violation of Federal law to use this product in a manner inconsistent with its labeling. **DO NOT** apply this product through any type of irrigation system. This label must be in the possession of the user at the time of herbicide application.

A preplant incorporated application of TRI-SCEPT may be made at the 2.33 pint per acre rate. For heavy sicklepod infestations Classic may be applied postemergence at 1/2 to 3/4 ounces per acre following a soil application of TRI-SCEPT. Apply the higher rate of Classic if sicklepod seedlings are taller than 2 inches. A cultivation 14 days after Classic application may be required to control sicklepod escapes. TRI-SCEPT followed by Classic sequential program may be used only in Use Region 1 (except Oklahoma) and Kentucky.

ROTATIONAL CROP RESTRICTIONS

Soybeans may be planted anytime. Field Corn may be planted 9 1/2 months after the last herbicide application. Barley, edible beans, grain sorghum, oats, peanuts, rice, tobacco, and wheat may be planted 15 months after the last herbicide application. Cotton may be planted 18 months after the last herbicide application. Refer to rotational crop restrictions listed in the Classic label. Always follow the more restrictive label.

Consult the TRI-SCEPT label for spraying and application information, weeds controlled, and use rates. When tank mixing, always follow the more restrictive label.

Use of TRI-SCEPT herbicide in accordance with label directions is expected to result in normal growth of rotational crops in most situations; however, various environmental and agronomic factors make it impossible to eliminate all risk associated with the use of TRI-SCEPT and, therefore, rotational crop injury is always possible.
