MKC PYRETHRUM FLY SHOT

CONCENTRATE

Active Ingredients 100%
Petroleum Hydrocarbons
* Technical Piperonyl
butoxide
Pyrethrins

*Equivalent to 6.00% of (butyl carbity) (6-propyl
piperonyl) ether and 1.50% of related compounds.

USDA Registration No. 259-28

ESPECIALLY PREPARED FOR KILLING

Bedbugs	Flies
Centipedes	Mosquitoes
Ants	Roaches
Moths	Water Bugs
Hornets	Spiders

GENERAL DIRECTIONS FOR USING PYRETHRUM FLY SHOT

TO KILL FLIES

Close all windows and doors and spray towards the ceiling, then in all cracks and crevices and around the base boards. Leave the room closed for about ten minutes; longer if the room be large. This treatment will also free the room of mosquitoes and other winged insects. Repeat as often as necessary.

ROACHES, WATER BUGS AND CENTIPEDES

Apply as above, and when the insects come from their hiding places give them a second spraying. This will also kill spiders and hornets. Repeat application as often as practical.

BED BUGS

After tightly closing the room, spray the bed frames, springs and surface of the mattress. The fumes will drive the bugs into the open, when a second spraying will kill them. Cracks around infested rooms should be sprayed.

MOTHS

Spray clothes chests and closets thoroughly, clothes lightly. Keep closed for fifteen minutes to a half hour, depending upon size of closet. Repeat application monthly unless treated articles are stored in moth-tight containers.

ANTS

In the pantry, spray around shelves, refrigerator, bread box and in crevices where food has lodged.

FLEAS ON DOGS

Spray the animal's coat of hair, also the bedding and kennel. Repeat at intervals of two days for one week. Best results will be obtained if the dog is first washed in luke-warm water with a good animal soap or preferably in water to which has been added a reliable coal-tar disinfectant.

Pyrethrum Fly Shot is a clear, amber fluid, with an agreeable, aromatic odor, specially prepared for the purposes named on this label.

It is non-injurious when used as directed and will not permanently stain or discolor fabrics, furniture, wallpaper, wood or metal work.

It is supplied in the form in which it is to be used. All that is necessary to apply it is a hand sprayer, which can be bought at any hardware or agricultural supply house. If spraying is to be done on an extensive scale, a compressed air sprayer might be found more suitable.

When not in use, the can or container should be kept tightly sealed, to prevent evaporation. Caution: Do not spray near or toward an open flame.
