

### DIRECTIONS FOR USE

The effectiveness of this spray to prevent apple drop depends upon good spray coverage and having foliage free from mite damage, magnesium deficiency, frost injury and severe scab infection.

**McINTOSH: For Immediate Market.** Apply about 7 to 8 days before harvest drop normally begins. Use 1/2 pint in 100 gallons of water (20 ppm). Pick fruit at proper maturity, but do not let fruit over ripen on trees. **Fruit to be Stored.** Apply spray 4 to 5 days before harvest drop normally begins. Use 1/2 pint in 200 gallons of water (10 ppm). This should control drop for 2 weeks. Fruit should be picked before chemical has lost its effectiveness.

**SUMMER VARIETIES:** For varieties such as Early McIntosh, Melton and Wealthy, apply spray 2 weeks before harvest. Use 1/2 pint in 100 gallons of water. For Williams Early Red, use 1/2 pint in 200 gallons of water and apply 2 weeks before harvest.

**FALL VARIETIES:** For Baldwin, Rome, Jonathan, Delicious, Spy, York and Staymen, apply spray about 2 weeks before harvest. Use 1/2 pint in 100 gallons of water.

**USE IN SPEED SPRAYERS:** This material has been used successfully in speed sprayers both in a concentrate or dilute form. For effective spraying of this chemical with a speed sprayer, contact your local agricultural authorities.

### PRECAUTIONS:

1. Time your sprays properly and use correct concentrations.
2. Do not apply more than 14 days before harvest.
3. Do not use more than one application per tree.
4. Harvest fruit when properly mature. Do not allow to become over ripe.
