CHILDREN DANGER

	FIRST AID
lf in eyes	Hold eye open and rinse slowly and gently with water for 15 to 20 minutes Remove contact lenses if present after the first 5 minutes then continue missing
If on skin or clothing	Take off contraminated clothing Rinse skin immediately with plenty of water for 15 20 minutes Call a poison control center or doctor for treatment advice
If swallowed	Call poison control or doctor immediately for treament or advice Have person sip a glass of water if able to swallow Do not induce vomiting unless told to do so by the poison control center or doctor Do not give anything by mouth to an unconscious person
If inhaled	Move person to fresh air If person is not breathing call 911 or an ambulance then give artificial respiration preferably mouth to mouth if possible Call a poison control center or doctor for further treatment advice
NOTE TO PHYSICIAN	NOTE TO PHYSICIAN Probable mucosal damage may contraindicate the use of gastric lavage

Have the product container or label with you when calling a poison control center or doctor or going for treatment

For emergency information on (product use etc.) call the National Pesticides Information Center at 1800 558 7378 6 30 AM to 4 30 PM Pacific time (PT) seven days a week. During other times call the poison control center 1 800 223 1222.

EPA EST NO 266 AZ 1 Reg No 266 40

DIRECTIONS FOR USE

IT IS A VIOLATION OF FEDERAL LAW TO USE THIS PRODUCT IN A MANNER INCONSISTENT WITH ITS LABELING

FOR SWIMMING POOL SANITATION AND INDUSTRIAL DISINFECTION AND SANITATION

For additional directions and uses refer to Hill Brothers Supplemental Sodium Hypochlorite Usage Bulletin

STORAGE AND DISPOSAL

spill flood areas with large quantities of water Product or runsates that cannot be used should be diluted with water before disposal in a sanitary sewer Refillable Container Refill this Do not contaminate water food or feed by storage disposal or cleaning of equipment Store this product in a cool dry area away from direct sunlight and heat to avoid deterioration In case of

amer with Sodyum Hypochlorite only Do not reuse this container for any other purpose ANC CEPTED

ĺ

DIRECTIONS FOR USE

IT IS A VIOLATION OF FEDERAL LAW TO USE THIS PRODUCT IN A MANNER INCONSISTENT WITH ITS LABELING

To achieve available chlorine (By Weight)	Gallons Water	Add liquid ounces of 5 25 % Sodium Hypochlorite
5 PPM	100	10
10 PPM	100	20
15 PPM	100	35
25 PPM	100	5 5
35 PPM	100	8 0
50 PPM	100	11 5
100 PPM	10	2 0
200 PPM	10	4 5
500 PPM	10	11 5
600 PPM	10	14 0
1000 PPM	10	23 0
5000 PPM	10	125
10 000 PPM	10	280

NOTE This product degrades with age Use a chlorine test kit and increase dosage as necessary to obtain the required level of available chlorine

SWIMMING POOL WATER DISINFECTION

For a new pool or spring start up super chlorinate with 110 to 230 oz of product for each 10 000 gallons of water to yield 5 to 10 ppm available chlorine by weight Check the level of available chlorine with a test kit Adjust and maintain pool water pH to between 7 2 and 7 6 Adjust and maintain the alkalinity of the pool to between 50 to 100 ppm

To maintain the pool add manually or by a feeder device 20 oz of this product for each 10 000 gallons of water to yield an available chlorine residual between 0.6 to 1.0 ppm by weight Stabilized pools must maintain a residual of 1.0 to 1.5 ppm available chlorine. Test the pH available chlorine residual and alkalinity of the water frequently with appropriate test kits. Frequency of water treatment will depend upon temperature and number of swimmers.

Every 7 days or as necessary super chlorinate the pool with 110 to 230 oz of product for each 10 000 gallons of water to yield 5 to 10 ppm available chlorine by weight Check the level of available chlorine with a test kit. Do not reenter pool until the chlorine residual is between 1 0 to 3 0 ppm

At the end of the swimming pool season or when water is to be drained from the pool chlorine must be allowed to dissipate from treated pool water before discharge. Do not chlorinate the pool within 24 hours prior to discharge.

WINTERIZING POOLS — While water is still clear & clean apply 7 oz of product per 1 000 gallons while filter is running to obtain a 3 ppm available chlorine residual as determined by a suitable test kit. Cover pool prepare heater filter and heater components for winter by following manufacturer s instructions

SPAS, HOT TUBS, IMMERSION TANKS, ETC

SPAS/HOT TUBS – Apply 12 oz of product per 1 000 gallons of water to obtain a free available chlorine concentration of 5 ppm as determined by a suitable chlorine test kit Adjust and maintain pool water pH to between 7 2 and 7 8 Some oils lotions fragrances cleaners etc cause foaming or cloudy water as well as reduce the efficiency of the product Reentry is prohibited above the level of 5 ppm chlorine due to risk of bodily injury

To maintain the water apply 12 oz of product per 1 000 gallons of water over the surface to maintain a chlorine concentration of 5 ppm

After each use shock treat with 16 oz of this product per 500 gallons of water to control odor and algae During extended periods of disuse, add 7 oz of product daily per 1 000 gallons of water to maintain a 3 ppm chlorine concentration

SANITIZATION OF POROUS FOOD CONTACT SURFACES SPRAY/FOG METHOD

Pre clean all surfaces after use Prepare a 600 ppm available chlorine sanitizing solution of sufficient size by thoroughly mixing the product in a ratio of 14 oz product with 10 gallons of water. Use spray or fogging equipment which can resist hypochlorite solutions. Always empty and rinse spray/fog equipment with potable water after use. Thoroughly spray or fog all surfaces until wet allowing excess sanitizer to drain. Vacate area for at least 2 hours. Prior to using equipment rinse all surfaces with a 200 ppm available chlorine solution. Prepare a 200 ppm sanitizing solution by thoroughly mixing 5 oz of this product with 10 gallons of water.

SANITIZATION OF NONPOROUS FOOD CONTACT SURFACES SPRAY/FOG METHOD

Pre clean all surfaces after use Use a 200 ppm available chlorine solution to control bacteria mold or fungi and a 600 ppm solution to control bacteriophage Prepare a 200 ppm sanitizing solution of sufficient size by thoroughly mixing the product in a ratio of 5 oz product with 10 gallons of water Prepare a 600 ppm solution by thoroughly mixing the product in a ratio of 14 oz product with 10 gallons of water Use spray or fogging equipment which can resist hypochlorite solutions. Always empty and rinse spray/fog equipment with potable water after use Thoroughly spray or fog all surfaces until wet allowing excess sanitizer to drain. Vacate area for at least 2 hours. Prior to using equipment rinse all surfaces treated with a 600 ppm solution with a 200 ppm solution.

SANITIZATION OF NONPOROUS NON-FOOD CONTACT SURFACES

RINSE METHOD – Prepare a sanitizing solution by thoroughly mixing 5 oz of this product with 10 gallons of water to provide approximately 200 ppm available chlorine by weight. Clean equipment surfaces in the normal manner. Prior to use rinse all surfaces thoroughly with the sanitizing solution maintaining contact with the sanitizer for at least 2 minutes. Do not rinse equipment with water after treatment and do not soak equipment overnight.

IMMERSION METHOD – Prepare a sanitizing solution by thoroughly mixing in an immersion tank 5 oz of this product with 10 gallons of water to provide approximately 200 ppm available chlorine by weight Clean equipment in the normal manner Prior to use immerse equipment in the sanitizing solution for at least 2 minutes and allow the sanitizer to drain Do not rinse equipment with water after treatment

SPRAY/FOG METHOD – Preclean all surfaces after use Prepare a 200 ppm available chlorine sanitizing solution of sufficient size by thoroughly mixing the product in a ratio of 5 oz product with 10 gallons of water Use spray or fogging equipment which can resist hypochlorite solutions Prior to using equipment thoroughly spray or fog all surfaces until wet allowing excess sanitizer to drain Vacate area for at least 2 hours

WAREWASHING

FOR SANITIZING TABLEWARE IN LOW TEMPERATURE DISHWASHING MACHINE – Dispense this product into final rinse water at 100 ppm available chlorine Do not allow concentration to fall below 50 ppm Air dry Dispenser must be set to deliver a sanitizing solution of 2 oz per 10 gallons of water to provide 100 ppm of available chlorine Only a qualified service representative shall set or adjust dispenser on the machine

DISINFECTION OF DRINKING WATER (POTABLE)

PUBLIC SYSTEMS Mix a ratio of 2 oz of this product to 100 gallons of water Begin feeding this solution with a hypo chlorinator until a free available chlorine residual of at least 0 2 ppm and no more than 0 6 ppm is attained throughout the distribution system Check water frequently with a chlorine test kit Bacteriological sampling must be conducted at a frequency no less than that prescribed by the National Primary Drinking Water Regulations Contact your local Health Department for further details

INDIVIDUAL SYSTEMS DUG WELLS - Upon completion of the casing (lining) wash the interior of the casing (lining) with a 100 ppm available chlorine solution using a stiff brush. This solution can be made by thoroughly mixing 2 oz of this product into 10 gallons of water. After covering the well pour the sanitizing solution into the well through both the pipe sleeve opening and the pipeline. Wash the exterior of the pump cylinder also with the sanitizing solution. Start pump and pump water until strong odor of chlorine in water is noted. Stop pump and wait at least 24 hours. After 24 hours flush well until all traces of chlorine have been removed from the water. Consult your local Health Department for further details.

INDIVIDUAL WATER SYSTEMS DRILLED, DRIVEN & BORED WELLS - Run pump until water is as free from turbidity as possible Pour a 100 ppm available chlorine sanitizing solution into the well. This solution can be made by thoroughly mixing 2 oz of this product into 10 gallons of water. Add 5 to 10 gallons of clean chlorinated water to the well in order to force the sanitizer into the rock formation. Wash the exterior of pump cylinder with the sanitizer. Drop pipeline into well start pump and pump water until strong odor of chlorine in water is noted. Stop pump and wait at least 24 hours. After 24 hours flush well until all traces of chlorine have been removed from the water. Deep wells with high water levels necessitate the use of special methods for introduction of the sanitizer into the well. Consult your local Health Department for further details.

INDIVIDUAL WATER SYSTEMS FLOWING ARTESIAN WELLS – Artesian wells generally do not require disinfection If analyses indicate persistent contamination the well must be disinfected Consult your local Health Department for further details

EMERGENCY DISINFECTION - When boiling of water for 1 minute is not practical water can be made potable by using this product Prior to addition of the sanitizer remove all suspended material by filtration or by allowing it to settle to the bottom Decant the clarified contaminated water to a clean container and add 2 drops of this product to 20 gallons of water Allow the treated water to stand for 30 minutes Properly treated water must have a slight chlorine odor if not repeat dosage and allow the water to stand an additional 15 minutes The treated water can then be made palatable by pouring it between clean containers several times

PUBLIC WATER SYSTEMS

RESERVOIRS ALGAE CONTROL – Hypochlorinate streams feeding the reservoir Suitable feeding points must be selected on each stream at least 50 yards upstream from the points of entry into the reservoir

MAINS – Thoroughly flush section to be sanitized by discharging from hydrants Permit a water flow of at least 2 5 feet per minute to continue under pressure while injecting this product by means of a hypo chlorinator. Stop water flow when a chlorine residual test of 50 ppm is obtained at the low pressure end of the new main section after a 24 hour retention time. When chlorination is completed the system must be flushed free of all heavily chlorinated water.

NEW TANKS, BASIN, ETC – Remove all physical soil from surfaces Place 50 oz of this product for each 5 cubic feet of working capacity (500 ppm available chlorine) Fill to working capacity and allow to stand for at least 4 hours Drain and flush with potable water and return to surface

NEW FILTER SAND – Apply 200 oz of this product for each 150 to 200 cubic feet of sand The action of the product dissolving as the water passes through the bed will aid in sanitizing the new sand

NEW WELLS – Flush the casing with a 50 ppm available chlorine solution of water containing 12 oz of this product for each 100 gallons of water The solution must be pumped or fed by gravity into the well after thorough mixing with agitation The well must stand for several hours or overnight under chlorination. It must then be pumped until a representative raw water sample is obtained Bacterial examination of the water will indicate whether further treatment is necessary.

EXISTING EQUIPMENT – Remove equipment from service thoroughly clean surfaces of all physical soil Sanitize by placing 50 oz of this product for each 5 cubic feet capacity, (approximately 500 ppm available chlorine) Fill to working capacity and let stand at least 4 hours Drain and place in service. If the previous treatment is not practical surfaces must be sprayed with a solution containing 12 oz of this product for each 5 gallons of water (approximately 1 000 ppm available chlorine) After drying flush with water and return to service

EMERGENCY DISINFECTION AFTER FLOODS

WELLS – Thoroughly flush contaminated casing with a 500 ppm available chlorine solution Prepare this solution by mixing 12 oz of this product with 10 gallons of water Backwash the well to increase yield and reduce turbidity adding sufficient chlorinating solution to the backwash to produce a 10 ppm available chlorine residual as determined by a chlorine test kit. After the turbidity has been reduced and the casing has been treated add sufficient chlorinating solution to produce 50 ppm available chlorine residual. Agitate the well water for several hours and take a representative water sample. Retreat well if water samples are biologically unacceptable **RESERVOIRS** – In case of contamination by overflowing streams establish hypo chlorinating stations upstream of the reservoir Chlorinate the inlet water until the entire reservoir obtains 0.2 ppm available chlorine residual as determined by a suitable chlorine test kit. In case of contamination from surface drainage apply sufficient product directly to the reservoir to obtain a 0.2 ppm available chlorine residual in all parts of the reservoir

BASINS, TANKS, FLUMES, ETC – Thoroughly clean all equipment then apply 50 oz of product per 5 cu ft of water to obtain 500 ppm available chlorine as determined by a suitable test kit. After 24 hours drain flush and return to service. If the previous method is not suitable spray or flush the equipment with a solution containing 12 oz of this product for each 5 gallons of water (1 000 ppm available chlorine). Allow to stand for 2 to 4 hours flush and return to service.

FILTERS – When the sand filter needs replacement apply 200 oz of this product for each 150 to 200 cubic feet of sand When the filter is severely contaminated additional product must be distributed over the surface at the rate of 200 oz per sq ft Water must stand at a depth of 1 foot above the surface of the filter bed for 4 to 24 hours When filter beds can be backwashed of mud and silt apply 200 oz of this product per each 50 sq ft allowing the water to stand at a depth of 1 foot above the filter 30 minutes drain water to the level of the filter After 4 to 6 hours drain and proceed with normal back washing

DISTRIBUTION SYSTEM – Flush repaired or replaced section with water Establish a hypo chlorinating station and apply sufficient product until a consistent available chlorine residual of at least 10 ppm remains after a 24 hour retention time Use a chlorine test kit

EMERGENCY DISINFECTION AFTER FIRES

CROSS CONNECTIONS OR EMERGENCY CONNECTIONS – Hypo chlorination or gravity feed equipment must be set up near the intake of the untreated water supply Apply sufficient product to give a chlorine residual of at least 0 1 to 0 2 ppm at the point where the untreated supply enters the regular distribution system Use a chlorine test kit

EMERGENCY DISINFECTION AFTER DROUGHTS

SUPPLEMENTARY WATER SUPPLIES – Gravity or mechanical hypochlorite feeders must be set up on a supplementary line to dose the water to a minimum chlorine residual of 0 2 ppm after a 20 minute contact time Use a chlorine test kit

WATER SHIPPED IN BY TANKS, TANK CARS, TRUCKS, ETC – Thoroughly clean all containers and equipment Spray a 500 ppm available chlorine solution and rinse with potable water after 5 minutes This solution is made by mixing 12 oz of this product for each 10 gallons of water During the filling of the containers dose with sufficient amounts of this product to provide at least a 0.2 ppm chlorine residual Use a chlorine test kit

EMERGENCY DISINFECTION AFTER MAIN BREAKS

MAINS – Before assembly of the repaired section flush out mud and soil Permit a water flow of at least 2 5 feet per minute to continue under pressure while injecting this product by means of a hypo chlorinator Stop water flow when a chlorine residual test of 50 ppm is obtained at the low pressure end of the new main section after a 24 hour retention time When chlorination is completed the system must be flushed free of all heavily chlorinated water

COOLING TOWER/EVAPORATIVE CONDENSER WATER

SLUG FEED METHOD – *Initial Dose* When system is noticeably fouled apply 110 to 230 oz of this product per 10,000 gallons of water in the system to obtain from 5 to 10 ppm available chlorine Repeat until control is achieved

Subsequent Dose When microbial control is evident add 22 oz of this product per 10 000 gallons of water in the system daily or as needed to maintain control and keep the chlorine residual at 1 ppm Badly fouled systems must be cleaned before treatment is begun

INTERMITTENT FEED METHOD – Initial Dose When system is noticeably fouled apply 110 to 230 oz of this product per 10 000 gallons of water in the system to obtain 5 to 10 ppm available chlorine Apply half (or 1/3 1/4 or 1/5) of this initial dose when half (or 1/3 1/4 or 1/5) of the water in the system has been lost by blowdown

Subsequent Dose When microbial control is evident add 22 oz of this product per 10 000 gallons of water in the system to obtain a 1 ppm residual Apply half (or 1/3 1/4 or 1/5) of this initial dose when half (or 1/3 1/4 or 1/5) of the water in the system has been lost by blowdown Badly fouled systems must be cleaned before treatment is begun

CONTINUOUS FEED METHOD - Initial Dose When system is noticeably fouled apply 110to 230 oz of this product per 10 000 gallons of water in the system to obtain 5 to 10 ppm available chlorine

Subsequent Dose Maintain this treatment level by starting a continuous feed of 2 oz of this product per 1 000 gallons of water lost by blowdown to maintain a 1 ppm residual Badly fouled systems must be cleaned before treatment is begun

BRIQUETTES OR TABLETS - Initial Dose Initially slug dose the system with 110 oz of this product per 10 000 gallons of water in the system Badly fouled systems must be cleaned before treatment is begun

Subsequent Dose When microbial control is evident add 22 oz of this product per 10 000 gallons of water in the system daily or as needed to maintain control and keep the chlorine residual at 1 ppm Badly fouled systems must be cleaned before treatment is begun

SEWAGE AND WASTEWATER EFFLUENT TREATMENT

The disinfection of sewage effluent must be evaluated by determining the total number of coliform bacteria and/or fecal coliform bacteria as determined by the Most Probable Number (MPN) procedure of the chlorinated effluent has been reduced to or below the maximum permitted by the controlling regulatory jurisdiction

On the average satisfactory disinfection of secondary wastewater effluent can be obtained when the chlorine residual is 0.5 ppm after 15 minutes contact Although the chlorine residual is the critical factor in disinfection the importance of correlating chlorine residual with bacteria kill must be emphasized The MPN of the effluent which is directly related to the water quality standards requirements must be the final and primary standard and the chlorine residual must be considered an operating standard valid only to the extent verified by the coliform quality of the effluent

The following are critical factors affecting wastewater disinfection

- Mixing It is imperative that the product and the wastewater be instantaneously and completely flash 1 mixed to assure reaction with every chemically active soluble and particulate component of the wastewater Contacting Upon flash mixing the flow through the system must be maintained 2
- 3 Dosage/Residual Control Successful disinfection is extremely dependent on response to fluctuating chlorine demand to maintain a predetermined desirable chlorine level Secondary effluent must contain 0 2 to 1 0 ppm chlorine residual after a 15 to 30 minute contact time A reasonable average of residual chlorine is 0 5 ppm after 15 minutes contact time

SEWAGE AND WASTEWATER TREATMENT

EFFLUENT SLIME CONTROL Apply a 100 to 1 000 ppm available chlorine solution at a location which will allow complete mixing Prepare this solution by mixing 22 to 230 oz of this product with 100 gallons of water Once control is evident apply a 15 ppm available chlorine solution Prepare this solution by mixing 3.5 oz of this product with 100 gallons of water

FILTER BEDS SLIME CONTROL Remove filter from service drain to a depth of 1 ft above filter sand and add 230 oz of product per 20 sq ft evenly over the surface Wait 30 minutes before draining water to a level that is even with the top of the filter Wait for 4 to 6 hours before completely draining and backwashing filter

COMMERCIAL LAUNDRY SANITIZERS

Wet fabrics or clothes must be spun dry prior to sanitation Thoroughly mix 5 oz of this product with 10 gallons of water to yield 200 ppm available chlorine Promptly after mixing the sanitizer add the solution into the prewash prior to washing fabrics/clothes in the regular wash cycle with a good detergent. Test the level of available chlorine if solution has been allowed to stand. Add more of this product if the available chlorine level has dropped below 200 ppm.

PULP AND PAPER MILL PROCESS WATER SYSTEM

SLUG FEED METHOD – *Initial Dose* When system is noticeably fouled apply 110 to 230 oz of this product per 10 000 gallons of water in the system to obtain from 5 to 10 ppm available chlorine Repeat until control is achieved

Subsequent Dose When microbial control is evident add 23 oz of this product per 10 000 gallons of water in the system daily or as needed to maintain control and keep the chlorine residual at 1 ppm Badly fouled systems must be cleaned before treatment is begun

INTERMITTENT FEED METHOD – *Initial Dose* When system is noticeable fouled apply 110 to 230 oz of this product per 10 000 gallons of water in the system to obtain 5 to 10 ppm available chlorine Apply half (or 1/3 1/4 or 1/5) of this initial dose when half (or 1/3 1/4 or 1/5) of the water in the system has been lost by blowdown

Subsequent Dose When microbial control is evident add 23 oz of this product per 10 000 gallons of water in the system to obtain a 1 ppm residual Apply half (or 1/3 1/4 or 1/5) of this initial dose when half (or 1/3 1/4 or 1/5) of the water in the system has been lost by blowdown Badly fouled systems must be cleaned before treatment is begun

CONTINUOUS FEED METHOD – *Initial Dose* When system is noticeably fouled apply 110 to 230 oz of this product per 10 000 gallons of water in the system to obtain 5 to 10 ppm available chlorine

Subsequent Dose Maintain this treatment level by starting a continuous feed of 2 oz of this product per 1 000 gallons of water lost by blowdown to maintain a 1 ppm residual Badly fouled systems must be cleaned before treatment is begun

BRIQUETTES OR TABLETS – *Initial Dose* Initially slug dose the system with 110 oz of this product per 10 000 gallons of water in the system Badly fouled systems must be cleaned before treatment is begun

Subsequent Dose When microbial control is evident add 23 oz of this product per 10 000 gallons of water in the system daily or as needed to maintain control and keep the chlorine residual at 1 ppm Badly fouled systems must be cleaned before treatment is begun

AGRICULTURAL USES

POST HARVEST PROTECTION – Potatoes can be sanitized after cleaning and prior to storage by spraying with a sanitizing solution at a level of 1 gallon of sanitizing solution per ton of potatoes Thoroughly mix 2 oz of this product to 2 gallons of water to obtain 500 ppm available chlorine

BEE CELLS & BOARDS – Disinfect leaf cutting bee cells and bee boards by immersion in a solution containing 1 ppm available chlorine for 3 minutes Allow cells to drain for 2 minutes and dry for 4 to 5 hours or until no chlorine odor can be detected This solution is made by thoroughly mixing ¼ oz of this product to 100 gallons of water The bee domicile is disinfected by spraying with a 0 1 ppm solution until all surfaces are thoroughly wet Allow the domicile to dry until all chlorine odor has dissipated

FOOD EGG SANITIZATION – Thoroughly clean all eggs Thoroughly mix 4 5 oz of this product with 10 gallons of warm water to produce a 200 ppm available chlorine solution. The sanitizer temperature must not exceed 130° degrees F. Spray the warm sanitizer so that the eggs are thoroughly wetted. Allow the eggs to thoroughly dry before casing or breaking. Do not apply a potable water rinse. The solution must not be re used to sanitize eggs.

FRUIT & VEGETABLE WASHING – Thoroughly clean all fruits and vegetables in a wash tank Thoroughly mix 11 oz of this product in 200 gallons of water to make a sanitizing solution of 25 ppm available chlorine. After draining the tank submerge fruit or vegetables for 2 minutes in a second wash tank containing the recirculating sanitizing solution. Spray rinse vegetables with the sanitizing solution prior to packaging. Rinse fruit with potable water only prior to packaging.

CONTROL OF FRUIT & VEGETABLE DECAY – Use this product to control organisms causing decay of fruits and vegetables after harvest Prior to use all fruits and vegetables must be thoroughly washed using an appropriate cleaning solution Remove all soils and other residues prior to treating with this product After washing transfer the fruits and vegetables to a separate tank containing the treatment solution

Apply at the concentration of available chlorine for various fruits and vegetables as listed in the table below To obtain a 100 ppm solution of available chlorine add 45 fl oz of this product to 200 gallons of water Maintain the pH of the solution between 6 0 and 8 0 with a dilute solution of hydrochloric acid or other approved buffer For other ppm concentrations use appropriate dilutions Rinse with potable water after treatment except as specified in the table

For citrus canker quarantine use at 200 ppm at pH 6 0 to 7 5 Apply for two minutes using a suitable spray or dip tank treatment

RICE SEED TREATMENT – To aid in surface sterilization of rice seed for prevention of bakanae disease Fusarium fukikuroi [syn F moniliforme] or Gibberella fujikuroi Mix 5 5 gallons of this product per 100 gallons of water to make a 3 000 ppm available chlorine solution Mix solution thoroughly then apply to seeds Soak the seeds for two hours then drain solution and replace with fresh water Continue seed soaking and draining as usual Do not apply undiluted product directly to seed

Alternatively make a 1,500 ppm available chlorine solution by mixing 2 3/4 gallons of this product with 100 gallons of water Mix solution thoroughly then apply seeds Soak and drain seeds as usual No rinsing is required Do not apply undiluted product directly to seed

Prepare a fresh solution for each batch of seed Do not use treated seeds for food or feed

MEAT & POULTRY PLANTS – This product must be used in processing water of meat and poultry plants at concentrations up to 5 ppm calculated as available chlorine. Chlorine must be present in poultry chiller intake water and in carcass wash water at concentrations up to 50 ppm calculated as available chlorine. Use a suitable test kit to adjust to desired available chlorine level. Chlorine must be dispensed at a constant and uniform level and the method or system must be such that a controlled rate is maintained. Thoroughly mix 2 oz of this product to 200 gallons of water to obtain 5 ppm available chlorine or 23 oz to 200 gallons of water for 50 ppm available chlorine.

AQUACULTURAL USES

FISH PONDS – Remove fish from ponds prior to treatment Thoroughly mix 230 oz of this product to 10 000 gallons of water to obtain 10 ppm available chlorine Add more product to the water if the available chlorine level is below 1 ppm after 5 minutes Return fish to pond after the available chlorine level reaches zero

FISH POND EQUIPMENT – Thoroughly clean all equipment prior to treatment Thoroughly mix 4 5 oz of this product to 10 gallons of water to obtain 200 ppm available chlorine Porous equipment must soak for one hour

MAINE LOBSTER PONDS – Remove lobsters seaweed etc from ponds prior to treatment Drain the pond Thoroughly mix 110 gallons of this product to 10 000 gallons of water to obtain at least 600 ppm available chlorine Apply so that all barrows gates rock and dam are treated with product Permit high tide to fill the pond and then close the gates Allow water to stand for 2 to 3 days until the available chlorine level reaches zero Open gates and allow 2 tidal cycles to flush the pond before returning lobsters to pond (NOT FOR USE IN CALIFORNIA)

CONDITIONING LIVE OYSTERS – Thoroughly mix 11 oz of this product to 10 000 gallons of water at 50° to 70° degree F to obtain 0 5 ppm available chlorine Expose oysters to this solution for at least 15 minutes monitoring the available chlorine level so that it does not fall below 0 05 ppm Repeat entire process if the available

chlorine level drops below 0 05 ppm or the temperature falls below 50° degree F (NOT FOR USE IN CALIFORNIA)

CONTROL OF SCAVENGERS IN FISH HATCHERY PONDS – Prepare a solution containing 200 ppm of available chlorine by mixing 4 5 oz of product with 10 gallons of water Pour into dreained pond potholes Repeat if necessary Do not put desired fish back into refilled ponds until chlorine residual has dropped to 0 ppm as determined be a test kit

SANITIZATION OF DIALYSIS MACHINES

Flush equipment thoroughly with water prior to using this product Thoroughly mix 14 oz of this product to 10 gallons of water to obtain at least 600 ppm available chlorine Immediately use this product in the hemodialysate system allowing for a minimum contact time of 15 minutes at 20° degree C Drain system of the sanitizing solution and thoroughly rinse with water Discard and **DO NOT** reuse the spent sanitizer Rinsate must be monitored with a suitable test kit to insure that no available chlorine remains in the system

This product is for decontaminating single and multi patient hemodialysate systems This product has been shown to be an effective disinfectant (virucide fungicide bactericide pseudomonicide) when tested by AOAC and EPA Test methods This product may not totally eliminate all vegetative microorganisms in hemodialysate delivery systems due to their construction and/or assembly but can be relied upon to reduce the number of microorganisms to acceptable levels when used as directed This product must be used in a disinfectant program which includes bacteriological monitoring of the hemodialysate delivery system. This product is NOT recommended for use in hemodialysate or reverse osmosis (RO) membranes.

Consult the guidelines for hemodialysate systems which are available from the Hepatitis Laboratories CDC Phoenix AZ 85021

DRIP IRRIGATION

This product when used properly will control bacterial and algae growth in the lines and emitters of a drip irrigation system and thereby provide a uniform distribution of water

CALIBRATION – If the irrigation water has high levels of nutrients causing bacterial algae and other biofouling that reduces system performance continuous chlorination must be necessary. The level of free residual chlorine for continuous feed is 1 to 2 ppm measured at the end of the farthest lateral using a good quality test kit for available chlorine. The available chlorine level must be checked periodically.

SHOCK TREATMENTS – Periodic shock treatments at higher available chlorine rate of up to 20 ppm free residual must be appropriate where bacteria and/or algae clogging and build up are not managed by maintaining a continuous residual The frequency of the chlorine shock application depends upon the frequency and extent of bio clogging

INJECTION – The rate of sanitizer injection into the irrigation water flow required to supply the desired available chlorine dosage in ppm can be estimated using the following equation

 $I = (0 \ 006) x \text{ (ppm desired) } x \text{ (system flow rate in gpm) / (bleach strength)}$

Where I is the injection rate in gallons per hour

For example To obtain 5 ppm available chlorine at a water flow rate of 30 gallons per minute while injecting 12 5% sodium hypochlorite solution you must inject

 $I = (0\ 006) x (5) x (30) / 5\ 25 = 0\ 17$ gallons per hour of 5 25% sodium hypochlorite solution

<u>NOTE</u> This calculation when applied to clean water which is free of amine nitrogen and organic nutrients will give a result close to the actual product injection rate required. In actual practice however contaminants in the water must consume sanitizer such that the available chlorine concentration is less than expected from the calculation. To correctly establish the product dose setting required, it is necessary to measure the available chlorine.

3/14

14/14

at the end of the treated increment in the field and adjust the sanitizer dose setting until the desired available chlorine concentration is obtained. Only experience can establish the actual injector settings required to provide the desired level of available chlorine at the end of the farthest lateral.

Injection must be started during irrigation near the end of the irrigation sequence but early enough to establish the desired available chlorine concentration throughout the system being treated Apply the sanitizer upstream of the filter to help keep the filter clean Determine the level of available chlorine as described in the Calibration section above using a chlorine test kit Allow sufficient time to achieve a steady reading

<u>DO NOT</u> apply sanitizer when fertilizers herbicides and insecticides are being injected since they will consume the available chlorine and could produce toxic reaction products

SENSITIVE PLANT SPECIES PRECAUTIONS – Certain plants including various species of trees flowers shrubs agronomic crops fruits and vegetables are adversely affected by chlorinated irrigation. The use of this product can impact growth appearance and health of the plants

Begonias geraniums and other ornamental plant species are known to be sensitive to continuous chlorination at levels of 1 2 ppm free chlorine Plant species such as tomato lettuce broccoli and petunia are sensitive to periodic chlorination levels of 10 20 ppm free chlorine

If uncertain of a plant s tolerance consult an agronomist or a support agency such as a University Extension Service or your local agent of the U S Department of Agriculture

STORAGE

Do not contaminate water food or feed by storage disposal or cleaning of equipment Store this product in a cool dry area away from direct sunlight and heat to avoid deterioration In case of spill, flood areas with large quantities of water

PESTICIDE DISPOSAL

Product or rinsates that cannot be used must be diluted with water before disposal in a sanitary sewer

Refillable container Refill this container with Sodium Hypochlorite only Do not reuse this container for any other purpose Cleaning the container before final disposal is the responsibility of the person disposing of the container Cleaning before refilling is the responsibility of the refiller

To clean the container before final disposal empty the remaining contents from this container into application equipment or mix tank Fill the container about 10 percent full with water Agitate vigorously or recirculate water with the pump for 2 minutes Pour or pump rinsate into application equipment or rinsate collection system Repeat this rinsing procedure two more times
