GENERAL DIRECTIONS GRAPES, GENERAL GUIDELINE Grapes, Thompson Seedless for Shipping Grapes, Other Seedless Varieties Grapes, Thompson Seedless for Raisins Grapes, Black Corinth Grapes, Wine Varieties Oranges, Navel Lemons Tangerine Hybrids Blueberries Sugar Cane DILUTION TABLE FOR SPRAYING Cherries, Sweet Cherries, Red Tart Artichokes Prune, Italian Celery Rhubarb, Forcing Hops Lettuce for Seed Potatoes, Seed CONVERSION TABLE, PPM TO GRAMS FORMULATIONS OF PRO-GIBB

PRECAUTIONS, IMPORTANT INFORMATION

Directions for Use

When a range is indicated, use the concentration and spray volumes recommended locally to obtain desired results.

SPRAY GUIDELINES FOR GRAPES

For all grapes, application is recommended by ground sprayer. Use 100 to 500 gallons as a dilute spray according to foliage density, or 30 to 80 gallons as a concentrate spray, unless specified otherwise. Do not exceed maximum rates. It is important to wet all berries thoroughly.

Thompson Seedless for Shipping

For cluster elongation ("Stretch"), looser cluster forms, and reducing cost of thinning, when used in conjunction with established girdling and thinning practices.

Guide: Apply 3 to 8.5 $grams^{(2)}/A$ before bloom when flower clusters are 3 to 5 inches long.

- For decreased berry set ("Thinning"), reducing handthinning costs, and hastened maturity.
 - Guide: Apply 3 to 12 grams^(z)/A during bloom. Higher amounts may cause an excess of shot berries or overthinning, except in high density plantings.
- For larger berries ("Sizing") and larger clusters when used in conjunction with established girdling and thinning practices.
 - **Guide:** Apply 8 to 48 grams^(z)/A as one application at or just after shatter (usually 2 to 3 days later), or as two applications of equal amounts with the first made at or just after shatter, followed during the next two weeks by the second application. Timing of the second spray will be dictated by experience in the vineyard to be sprayed and temperatures occurring during the interim between sprays. Potential effect will be reduced if the second spray occurs more than two weeks after the first application.

Other Seedless Varieties such as Perlette, Seedless Tokay, Interlocken Series and Related Hybrids

For larger berries and larger clusters when used in conjunction with established girdling and thinning practices.

(z) Refers to actual Gibberellic Acid. See Tables to convert to amount of for mulated Pro-Gibb needed

For decreasing berry set, with increased raisin quality, and hastened maturity.

Wine Varieties

Tinta Mad Palomino Carignane Valdepena Aleatico

Zinfandel Petite Sira

Chenin Bla

Green Hu

Grenache Alicante

Salvadore

(z) Refers to actual Gibberellic Acid. See Tables to convert to amount of for mulated Pro Gibb needed

Guide: Apply 8 to 48 grams(z)/A as one application at or just after shatter (usually 2 to 3 days later) or as two applications of equal amounts not to exceed a total of 48 grams (z)/A, with the first made at or just after shatter, followed during the next two weeks by the second application. Timing of the second spray with split application will be dictated by experience in the vineyard to be sprayed and temperatures occurring during the interim between sprays. Potential effect will be reduced if the second spray occurs more than two weeks after the first application.

Thompson Seedless for Raisins

Guide: Apply 0.75 to 6 grams^(z)/A during bloom.

Black Corinth (Zante Currant)

For improving berry size.

Guide: Apply spray containing 1 to 8 grams^(z)/A 3 to 5 days after full bloom, but before shatter begins.

For looser clusters to reduce incidence of bunch rot.

Guide: Apply one spray when shoots are 15 to 20 inches long. Clusters should average 3 to 4 inches in length and may range from 2 to 5 inches in length. It is important that the proper rate be used on each variety; if indicated rates are exceeded, reduction in yield may occur during the year of application and the following year. Concei trations for registered varieties are shown below with the required dilute gallonage.

	PPM	Grams(z)/A	Gal./A
leira	1 to 2.5(z)	0.4 to 1(z)	100
e as	2 5 to 5	1 to 2	100
ah Ianc	5 to 10	2 to 4	100
ngarian	10 to 20	4 to 8	100
•	20	8	100
2	20 to 40	8 to 16	100

NAVEL ORANGES (California)

To delay aging of the rind and reduce rind disorders (e.g., rind staining, water spotting, sticky or tacky surface, puffy rind and rupture under pressure) and to produce a more orderly harvesting pattern.

EARLY SPRAY (October/November — before any color change).

Apply to groves where harvest is not anticipated before March 1. The delay in rind aging is greatest when the early spray is applied before a color change. This spray timing produces the firmest rind possible.

Guide: Apply one spray in Oct. or Nov. before any color change. Use 5 to 20 $ppm^{(z)}$; 400 to 500 gal./A on large mature trees.

CAUTION: Do not apply to groves that may be harvested before Mar. 1 as a reduction in grade may result due to the delayed coloring. Do not apply in white wash sprays in which lime or other caustic material has produced a high pH in the spray tank.

LATE SPRAY (December/January — after marketable color is reached).

Apply to groves where harvest may be before March 1 (or not known).

Guide: Apply one spray in Dec. or Jan. just after marketable color has developed. Use 5 to 20 ppm^(z); 400 to 500 gal./A on large mature trees.

CAUTION: Sprays applied in late Jan./Feb. may cause reduced production the following year. Do not apply within 10 days of harvest. Do not spray navel orange trees between Feb. 15 and Aug. 1.

LEMONS (California)

- To decrease the amount of small tree ripe fruit and to produce a more desirable production pattern in relation to market demand.
 - Guide: Apply in a single spray in November or December to control fruit maturity by delaying development of yellow colored fruit. Use 10 $ppm^{(z)}$; 500 gal. A on large mature trees.

When applied two years in a row, an even larger difference in harvost pattern and maturity oc-CUIS.

- CAUTION: Do not apply within one month of harvest. Do not apply in spring or summer
- (z) Refers to actual Gibberellic Acid. See Tables to convert to amount of formulated Pro-Gibb needed

tangerine.

others.

Guide: Make a single foliage spray application at full bloom (when over 75 percent of all flowers are fully open). For Weymouth, application can be delayed up to two weeks after full bloom to affect sizing of shot berries. Use Pro-Gibb 3.91% Liquid Concentrate. Mix 80 fluid ounces in 100 gallons of water. Use of a

spreader-sticker is recommended. Apply to the point of run-off, thoroughly wetting all parts of the plant. Total gallonage will depend on size and density of the plants.

(z) Refers to actual Gibberellic Acid. See Tables to convert to amount of formulated Pro-Gibb needed

TANGERINE HYBRIDS (Florida)

To increase fruit set and yields on tangerine hybrids (tangelos, tangerines) with pollination problems such as the Orlando tangelo, Robinson, and Minneola

Guide: Apply spray during full bloom. Be sure to wet the leaves sufficiently.

> Fruits are generally seedless. Use 5 to 15 ppm^(z); 400 to 500 gal./A on large mature trees.

> CAUTION: A slight increase in mature leaf drop occurs at concentrations above 25 ppm. Fruit sizes may be reduced and color development slightly retarded.

BLUEBERRIES

For improving fruit set. For set problems due to insufficient natural honeybee pollination on varieties such as Coville, Jersey, Stanley, Earlieblue, Weymouth and

> CAUTION: Do not exceed 300 gallons per acre. Although some varieties bloom closer to harvest than others --- in no case should application be made closer than 40 days before harvest. Do not apply to plants in a low state of vigor.

SUGAR CANE (Hawaii)

Use Pro-Gibb Plus 10% Soluble Powder

Tor increase in sucrose yield.

Guide: Apply 28 to 84 grams^(z) in 7 to 10 gallons of spray per acre by airplane. Uniform coverage is (continued on page 10)

SUGME (ME (continued)

essential for maximum response. Use 56 grams as a single treatment, or 28 grams two or three times in separate applications with 30 to 45 day intervals. Application may be made to cane during the first and/or second year of culture. Young cane should be at least three months old to avoid possible tiller reduction. Application should not be made less than 4 months prior to harvest

Application should be made when growth rate is depressed by temperature. Cane grown below 1,500 feet elevation will benefit from applications made during November through March.

Cane should be treated when there is sufficient soil moisture from rain or irrigation to sustain a high growth rate for at least 30 days following each treatment. Lack of water will negate treatment effect.

- To delay harvesting, to produce a brighter chlored, firmer fruit, and to increase size.
 - Guide: Apply spray when the fruit is light green to straw colored. Apply spray to thoroughly wet the entire tree. Use 10 to 20 $pp n^{(z)}$; 400 to 600 gal./ A on large mature trees.

CAUTION: Do not apply within one week of harvest

RED MARI CHENRIES

- To counteract the effect of cherry yellow virus by increasing the development of lateral vegetative buds for subsequent production of leaves, spurs, and lateral shoots, thus increasing yield of infected orchards.
 - Guide: Apply an outside spray from 10 to 14 days after bloom (about the stage of shuck split). Be sure lower limbs are well covered. The addition of one pint of U.S.P. glycerin or a polysorbate wetting agent may enable reduction of the concentration to the lower recommended levels. Perennial treatment is necessary to maintain satisfactory fruit spur production and yields from each successive season's growth. Use 10
- (z) Refers to actual Gibbereilic Acid. See Tables to convert to amount of for mulated Pro Gibb needed

(z) Refers to actual Gibberellic Acid. See Tables to convert to amount of for mulated Pro Gibb needed.

to 20 $ppm^{(z)}$; 200 to 400 gal./A on large mature trees.

CAUTION: Do not spray within one month of harvest. Too high concentrations will increase leafy growth at the expense of fruit production the following year and excessive fruit production the year after that.

ARTICHUNES (California)

To accelerate maturity of artichokes and to shift the harvest to an earlier date.

- Guide: Apply spray in the fall up to November 1. Be sure the entire plant (leaves, stems and buds) are covered to point of run-off. Use 25 ppm^(z); 35 to 50 gal./A.
 - **CAUTION:** Do not apply within seven days of harvest

ITALIAN PRUNE

(Washington, Oregon, Idaho)

Tor reduction in internal browning and watery pits of the Italian prune and to increase yields.

- Guide: Apply spray three to four weeks prior to harvest (approximately 10 days post pit hardening). Be sure to wet each tree thoroughly. Use 50 $ppm^{(z)}$; 200 to 300 gal./A.
 - CAUTION: Do not apply less than two weeks before harvest.

VELTRY

To increase plant height and yield and overcome stress. due to cold weather conditions, or saline soils and to obtain earlier maturity.

- Guide: Apply spray one to four weeks prior to harvest. Lower concentrations are applied at the three to four week interval. Higher concentrations at the one to two week interval. Use 25 to 50 ppm^(z); 25 to 50 gal./A.
 - **CAUTION:** Do not apply earlier than four weeks before harvest as gibberellic acid may induce bolting (seed stalk formation)
 - Applications made less than one week preharvest may result in residues
 - Celery plants must be harvested when mature to ensure quality

FORGING PRESERT

- To increase yield of marketable forced rhubarb and to break dormancy on plants receiving insufficient chilling.
 - Guide: Apply 2 fl. oz (60 ml.) of a 500 ppm^(z) solution to each cleaned crown, when the rest period is not completely broken. When the rest period is broken by cold weather, apply 2 fl. oz. (60 ml.) of a 250 ppm solution.
 - CAUTION: Keep forcing house temperatures at 40 to 50°F. for 24 hours after application. If house is warmer than 50°F., the crowns should be covered with plastic. Temperatures in the forcing house above 50°F, will result in lower yields and poor stalk color

HOPS

For seeded and seedless Fuggle hops and similar varieties adapted to Oregon and the Northwest.

- To increase yield and pickability.
 - Guide: Apply spray when vine growth is five to eight feet in length. Use 10 $ppm^{(z)}$; 100 to 150 gal./A. CAUTION: Do not apply within three weeks of harvest.

(a) To obtain uniform bolting and increase seed production.

Guide: Apply the following spray schedule:

Growth Stage	ppm(z)	g.(z)/A	Gal./Acre
4 leaf stage	10	04	10
8 leaf stage	10	16	40
12 leaf stage	10	4	100

CAUTION: Do not feed crop wastes to livestock

(z) Refers to actual Gibberellic Acid. See Tables to convert to amount of for mulated Pro Gibb needed

(z) Refers to actual Gibberellic Acid. See Tables to convert to amount of for mulated Pro-Gibb needed

•

SEED POTATOES

To stimulate uniform sprouting --- for maximum production, more uniform development, fewer late maturing plants, and to break dormancy of newly harvested potatoes that have not had a full rest period.

Guide: Dip freshly dug seed pieces in a solution containing 0.5 to 1 ppm^(z) prior to planting.

> CAUTION: If soil temperature is very high, avoid treating rested seed and use the minimum concentration for dormant seed

CUNVERSION TABLE

Three forms of Pro-Gibb brand Gibberellic Acid are now available to better serve the needs of individual growers.

(Registered for use on Navel Oranges, Sugar Cane and all varieties Active Ingredient.

Gibberellic Acid^(z) . . . 10% W/W EPA Reg. No.: 275-20-AA-50546

Active Ingredient: Gibberellic Acid^(z)... 2% W/W Equivalent to approximately 0.5 gram^(z) of Gibberellic Acid per fluid ounce of product. EPA Reg. No.: 275-12-AA-50546

WARNING: Gibberellic Acid is an extremely potent plant growth regulator. For best results, read all directions for use thoroug dy. Consult your local experiment station specialist, distributor, or the Abbott agricultural specialist in your area for the spray schedule best suited to your conditions.

Discard any unused spray material at the end of each day. New solutions should be mixed only in a clean, empty spray tank. For best results, applications should be made during cooler parts of the day.

Use only as directed Good spray prectices should be followed. The public mould be need company and understood before making applications. Effectiveness requires that all parts of plant or crop must receive spray or desired result will not occur, so spray thoroughty. When a range of rates are indicated, use the commitation and spray volume recommended locally.

Gibbenellic Acid is a naturally occurring compound, produced by Abboit Laboratorius in a biological process.

NO ACE TO USER

Selier moments normanically, express or inoplied, of merchaniability ferross or observice concerning use of this product other this as indicated on the Island, Liner assumes all risks of use, storage or bendling not in electrocordonice with accompanying directions.

CAUTIONI REEP OUT OF REACH OF CHILDPEN. If powder gets in eyes, flush thoroughly with water. Marmful if swallowed

WARMING: FLAMMABLE (Liquid Formulations)

Keep away from heat or open flame. Keep container tightly closed when not in use. Use with adequate ventilation. Avoid breathing vapor.
