When used as directed, this product will aid in controlling and/or preventing the development of unsanitary slime conditions which are unsightly, produce foul odors and which are often the cause of equipment breakdown.

DIRECTIONS FOR USE

Initial Dose: Slug dose 1-2 gallons per 5000 gallons of water in the system when microbial growths are visible. Repeat as needed until control is evident.

Periodic or Subsequent Dose: In systems where microbial control is evident, feed 1-3 quarts to 5000 gallons of water in the system every 7 days or sooner should visible growth appear.

Add this product on distribution decks, tower basin or sump.

For best results, rid system of organic debris if possible. If soap or anionic detergent is used, rinse thoroughly before charging with this product.

Do not be alarmed with the sudden appearance of a considerable amount of organic debris in the system during the first week of operation. This is normal and is a good indication that this has effectively penetrated and dislodged dead organic material which tenaciously adheres to metal and wooden surfaces as living matter.

This product is compatible with virtually all corrosion inhibition additives, but should not be used in the presence of soap or other anionic detergents.
