PREPLANT SHALLOW INCORPORATED APPLICATIONS FOR WEED CONTROL IN WINTER WHEAT IN THE STATES OF TX, OK, KS, NE, SD

DIRECTIONS FOR USE

Finesse® may be applied PREPLANT SHALLOW INCORPORATED to winter wheat at 2/10 to 5/10 oz per acre. Apply "Finesse" before winter wheat is planted and incorporate into the top 1 inch of soil. Refer to the "Finesse" label for a list of weeds controlled/suppressed. The 5/10 oz per acre rate is only recommended for suppression* of Bromus species (cheat, downy brome, Japanese brome) and annual ryegrass.

Do not apply "Finesse" PREPLANT SHALLOW INCORPORATED to late fall plantings when cold and/or dry weather can cause delayed seedling emergence and/or stress to seedling plants. Under these conditions, wait until crop has emerged and is showing good vigor before making a postemergence treatment. Crop injury may result when PREPLANT SHALLOW

INCORPORATED applications of "Finesse" are made to wheat seeded less than 1" deep. "Finesse" should not be used on soils with a pH below 5.0 as additional crop stress from low pH and aluminum toxicity may result in crop injury.

If suppression of Bromus species or annual ryegrass is not satisfactory, a sequential application of a metribuzin product (such as Lexone DF) may be applied at 3 to 6 oz per acre in the fall once the wheat has reached the 4 to 5 leaf stage of growth and the annual grassy weeds are in the 1 to 3 leaf stage of growth.

Refer to the "Finesse" and metribuzin product for additional precautions and rotational crop guidelines.

IMPORTANT

BEFORE USING "FINESSE", READ AND FOLLOW ALL APPLICABLE DIRECTIONS, RESTRICTIONS AND PRECAUTIONS ON THE EPA-REGISTERED LABEL.

This bulletin contains new or supplemental instructions for use of this product which do not appear on the EPA-registered package label. Follow the instructions carefully.

This labeling must be in the possession of the user at the time of pesticide application.

D-021798

*Weed suppression is a visible reduction in weed competition (reduced population and/or vigor) as compared to an untreated area.

Degree of suppression will vary with rate used, size of weeds, and environmental conditions following treatment.
