SYSTEMIC FUNGICIDE FOR RUST CONTROL
OF CARNATIONS IN GREENHOUSES

GENERAL INSTRUCTIONS

Plantvax-5L is a liquid formulation designed for use in the control of carnation rust (*Uromyces dianthi*). It can be used in conjunction with a regular watering and fertilizing program. Plantvax-5L is particularly recommended for use during major rust problem months.

RECOMMENDED DOSAGE

For the control of carnation rust in greenhouses. Use at a dosage of 5 ppm in a typical watering and liquid fertilizing schedule of one gallon per square foot of soil applied every 10 days.

For example, a 5 ppm watering solution of Plantvax may be prepared by one gallon of Plantvax-5L to 50 gallons of water applied and further diluted with a 1:200 injector.

A Gates system used for regular watering and fertilizing is suitable for the carnation, feeding the liquid material through plastic tubing to the base of the plant and the soil for root absorption of the chemical.

Other types of fertilizer injectors may be used where adjustments are made to apply the correct amount of chemical per square foot. Under severe rust conditions a 10 ppm dosage may be used.

CAUTION!

Harmful if swallowed. Avoid inhaling spray. Wash hands and face thoroughly with soap and water after use or before eating or smoking. Avoid contact with eyes and clothing. In case of contact with eyes, flush immediately with water and get medical attention. Keep away from food and food products.

CONTAINER DISPOSAL Bury 18 inches below soil surface at safe disposal site. Never reuse for food or water.
