

DIRECTIONS

Hill Commercial Automatic Aerosol Insecticide is especially designed for electrically operated automatic aerosol dispensers. One unit for each 6,000 cubic feet of space to be treated is recommended. A specific amount of concentrated insecticide is automatically released every 15 minutes through the periodic activation of the metered valve. After two hours of operation, enough insecticide is suspended in the air to kill a proportion of the flies, gnats, or mosquitoes present, thereby greatly reducing their numbers. Effectiveness of Hill Aerosol insecticide will be noticed within one hour after the electric dispensers has been activated. If less than 24 of insect control is required, the electric dispenser should be set to start one hour before control is required and allowed to continue to run one hour after control is no longer necessary.

The rate of air change, shape of space to be treated, temperature, humidity, and other conditions affect insect activity. Although one dispenser per each 6,000 cubic feet of space may be considered as average, adjustments should be made if necessary, depending upon the conditions under which the units are to be used. Large drafts of forced ventilation may reduce or eliminate the insecticidal efficiency of these installations.

This 12 ounce can of Hill Commercial Automatic Aerosol Insecticide contains approximately 3,300 "shots" and will operate at 15 minute intervals for a total of 825 hours or 34 days on a continuous 24 hour basis, or 68 days on a 12 hour basis. If operating on a 24 hour basis, container should be replaced once a month. If on a 12 hour basis container should be replaced every two months.
