

**DIRECTIONS FOR USE**

POLE-TREAT is a ready-to-use penetrat- ing preservative coating designed for the on-site treatment of standing poles and for the treatment of the groundline area of poles in the yard that will be relocated or that have been in storage for prolonged periods. POLE-TREAT is also useful for the treatment of piling cut-offs.

**Standing Poles:** Use POLE-TREAT only on poles-in-line found by qualified inspector to be satisfactory for continued service. Dig a trench around the pole to the depth determined by the inspector to be necessary for the application of the preservative treatment. This may vary from 12 inches in wet areas to 18 inches or more in arid regions. Scrape away dirt and decayed wood from pole surface. Apply POLE-TREAT as a coating 1/4 inch in thickness extending from the bottom of the trench to a pre-determined height—from 2 inches to 12 inches above ground line to suit local conditions. Application may be by brush, paddle, scoop or mechanical applicator. Wrap the treated section with plastic coated kraft paper, stapling the paper to the pole. Alternately POLE-TREAT may be applied to a suitable wrapping material, and this wrapper may then be stapled to the pole before back filling the trrenched area.

For best results, in general, the moisture content of wood should be less than 30% when the preservative coating is applied.

**Piling Cut-Offs:** Treat the cut-end with a coating 1/4 inch to 1/2 inch thick.
