KEEP OUT OF REACH OF CHILDREN HAZARDOUS LIQUID AND VAPOR MAY BE FATAL IF INHALED, ABSORBED THROUGH SKIN, OR SWALLOWED CAUSES BURNS OF SKIN OR EYES COMBUSTIBLE

Do Not Get in Eyes, on Skin, or on Clothing. Wear Eye and Skin Protection Necessary to Prevent Contact When Handling This Material. Wash Thoroughly after Handling and Before Eating and Smoking. Wash Contaminated Clothing and Air Contaminated Shoes Thoroughly Before Reuse. DO NOT USE, POUR, SPILL, OR STORE NEAR HEAT OR OPEN FLAME. Use Only with Adequate Ventilation. Do Not Breathe Vapor.

In case of coll tact, immediately remove contaminated clothing and shoes, and wash skin with soap and plenty of water. for eyes, flush with flowing water for at least 15 minuter, and get medical attention.

In case of spillage indoors have available an approved full face mask equipped with a fresh black canister meeting specifications of the U-S Bureau of Mines for organic vapors, a full face self contained breathing apparatus, or full face air supplied respirator.

If inhaled, remove to fresh air. Use artificial respiration if breathing has stopped. Get immediate medical attention. Keep patient absolutely quiet. If swailowed, call a doctor. Induce vomiting by giving an emetic such as 2tablespoonfuls of table salt in a glass of warm water.

TELONE II SOIL FUMIGANT

GENERAL INFORMATION

Use TELONE II soil furnigant only as a preplanting soil treatment to control plant parasitic nematodes [rootknot, meadow (lesion), citrus, cyst formers (golden, sugar beet, soybean), burrowing, ring, spiral, sting, pin, stubby root, stylet, dagger]; also to control wireworms and garden centipedes (symphylans). Fumigate land to be planted to the crops listed below by applying TELONE II under the conditions, and at the rates recommended under DIRECTIONS FOR USE, DOSAGE AND USE RECOMMENDATIONS, and USE PRE-CAUTIONS. Read the entire label before using TELONE II.

Nursery Crops including floral plants, ornamentals, shrubs, and t and vine and bramble fruits of all types.

DIRECTIONS FOR US

WHEN TO TREAT: Apply TELONE II either in the spring or fall, w For best results with annual crops, treat the soil each year. In north ment (before October 15) is best for land to be planted to early spin such as celery, tomatoes, and nursery and orchard stock. Early fa crop. Note: Treat muck soils only in the early fall and plant as late as (clay) soils only when they are near or at the wilting point. Do no when it is cold and/or wet.

SOIL PREPARATIONS: TELONE II gives best results when condition through the soil and the soil surface can be sealed to prevent exce period. The soil should be in good seed bed condition, free of a moisture at about one-half of field capacity, and temperature betwee If undecomposed plant debris is present, it should be plowed down a TELONE II. Tillage deeper than 12 inches is necessary for good fu or "plow" pan occurs at plow depth. Where deep tillage is used, the to simultaneously apply the fumigant and thus avoid going over t

APPLICATION: TELONE II may be applied either as an overall (bro application equipment that will ensure placement of the fumigant surface. For overall application use either plowsole or chisel equi apart. When the fumigant is injected at a depth of 12 inches or more up to twice the application depth but should not exceed 30 inche direction or at an angle to the direction of the planting row, application, use chisel equipment with one chisel per row or two cl the soil where the crop is to be planted. When one chisel per row distribute about 1¹/₃ times more fumigant per chisel than is recomm chisels are used per row, apply at the same flow rate per chisel as fumigant required per acre will decrease as the distance between of planting, avoid placing the seed row directly over the furrow le chisel is used per row, place the seed 3 to 4 inches to one side of the plant in the center of the area between the chisel furrows.

SEALING: Immediately after application, compact the soil surface chisel application, use a roller, cultipacker, or similar sealing dev land, then compact it by floating or rolling. Sealing after row applic wheel, by listing, or by bedding so that the fumigant will be 12 to 1 fumigating listed rows, seal in the fumigant with ring rollers, pres

EXPOSURE PERIOD: After application and sealing, leave the so exposure period will be required if the soil becomes excessively

AERATION AND PREPARATION OF SOIL BEFORE PLANTING: the soil to aerate completely before planting the crop. Aeration TELONE II is no longer evident. Under optimum soil and weathe time for each 10 gallons of TELONE II applied per acre. When TELC and shrub planting sites, a 3 to 6 months aeration period should b if heavy rains or low temperatures occur during the exposure treatment zone. After row treatment use a knife-like chisel in the b possible recontamination of the treated soil. To hasten aeration after to the depth of the treatment zone. This is especially desirable of muck soils

quackgrass and for suppression of the damaging effects of Vertici potatoes. Apply as an overall treatment according to the following

Time of Treatment	Gallons per Acre	
Spring	17 to 25	
Fall	25 to 34	

Mint in Northwestern States: Use 59 gallons of TELONE II per acre overall treatment in the spring, or preferably in the fall, to aid in the Verticillium wilt in disease infested land to be used for minit module weeks or until the odor of the fumigant has left the soil before plantin Station or State Extension Service Specialists for the use of othe weed control and cultural practices when using TELONE II as Verticillium wilt

USE PRECAUTIONS

"Use the higher rates in heavier scal

-For cyst forming hematodes increase dosage to 18 galloris per acre (53.1) oz. 1000 ft row per chiseli

"For muck soils containing less than 30% organic matter use 18 gallons per acre *For Hawaiian pineapple, application may be made at time of or just before planting

For burrowing nematode in citrus, niect, in 18 inch centers, 12 inches deep. Keep free of plants susi eptible to burrowing nematodes for 2 years before replanting to citrus.

*Row treatment is not recommended for potatoes in irrigated areas of western and northwestern states

Tree planting sites prepared by backhoeing may be treated by pouring 27 fillozil of TELONE II into the hole during backfilling. For best results prepare and treat sites in the fall and plant in the spring

"Use TELONE II as an aid in the control of bacterial canker and decline of peach trees by application as a preplant, overall treatment of light (sandy) soils at the rate of 24 to 36 gallons per acre (71 to 106 fl. oz. 1000 ft. row per chisel) preferably in the fall when the soil is warm (50-85 F at 6-inch depth) and moist. Inject the fumigant at a depth of 10 to 12 inches with chisels mounted on 12 inch centers. Follow directions for soil preparation, sealing, exposure, and aeration as specified elsewhere on this label

• NOTE: To control symphylans (garden centipedes) use only overall at 18 or more gallons per acre. and apply during late summer or early fall when the soil is warm. To control wireworms use the higher dosages recommended for nematodes in overall or broadcast treatments

White Potatoes in Northwestern States: Use TELONE II as a spring or preferably a fall treatment to control

SEALING: Immediately after application, compact the soil surface t chisel application, use a roller, cultipacker, or similar sealing deviland, then compact it by floating or rolling. Sealing after row application wheel, by listing, or by bedding so that the fumigant will be 12 to 14 fumigating listed rows, seal in the fumigant with ring rollers, prest

EXPOSURE PERIOD: After application and sealing, leave the soil exposure period will be required if the soil becomes excessively ci-

AERATION AND PREPARATION OF SOIL BEFORE PLANTING: A the soil to aerate completely before planting the crop. Aeration TELONE II is no longer evident. Under optimum soil and weather time for each 10 gallons of TELONE II applied per acre. When TELOF and shrub planting sites, a 3 to 6 months aeration period should be if heavy rains or low temperatures occur during the exposure p treatment zone. After row treatment use a knife-like chisel in the be possible recontamination of the treated soil. To hasten aeration after to the depth of the treatment zone. This is especially desirable of muck soils.

quackgrass and for suppression of the damaging effects of Verticilli potatoes. Apply as an overall treatment according to the following (

Time of Treatment	Gallons per Acre
Spring	17 to 25
Fall	25 to 34

Mint in Northwestern States: Use 59 gallons of TELONE II per acre (overall treatment in the spring, or preferably in the fall, to aid in the Verticillium wilt in disease infested land to be used for mint producti weeks or until the odor of the fumigant has left the soil before planting Station or State Extension Service Specialists for the use of other weed control, and cultural practices when using TELONE II as a Verticillium wilt

USE PRECAUTIONS

Important — Note Carefully. Fumigation may temporarily raise the salts in the soil. This is most likely to occur when heavy rates of fertilizi are either cold, wet, acid, or high in organic matter. To avoid injury to tests made after fumigation. To avoid ammonia injury or nitrate starva soils do not use fertilizers containing nitrates until after the crop is we is above 65 F

Certain crops including cotton, sugarcane, and pineapple are tolerar not apply to them. When using high rates of TELONE II as required liming of highly acid soils before fumigation may stimulate nitrif ammonia toxicity. Certain nursery crops such as citrus seedlings, C vegetable crops such as cauliflower have shown evidence of phosp To avoid this possible effect, it is suggested that additional phosp experience indicates a deficiency may occur

Attention: To avoid reinfestation of treated soil do not use irrigation or crop remains that could carry soilborne pests from infested land. C

Since TELONE II soil fumigant is corrosive under certain c indition kerosene immediately after use DO NOT USE WATER Do not use equipment made of aluminum, magnesium or their alloys, as under severely corrosive to such metals. Common protective clothing, suc be penetrated readily by this material. Polyethylene provides a go shoes and hands with polyethylene bags. Store TELONE II in tightly (from dwellings. In outside storage, store drums on their sides to avoir or bottom recessed areas

Do not allow contamination of seeds plants fertilizers or other pet food feedstuffs, or domestic water supplies

To avoid injury to fish and other wildlife, do not spill or empty TEI bodies of water

Rinse equipment and containers and dispose of wastes by burying supplies. Dispose of empty containers by punching holes in them ai Use this product only as specified on this label

NOTICE: Seller warrants that the product conforms to its chemical description and label when used in accordance with directions under normal conditions of use, but MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE express or implied label instructions or under abnormal conditions or under conditions not reasonable risk of any such use

Nursery Crops including floral plants, ornamentals, shrubs, and bushes; forest, shade, fruit and nut trees and vine and bramble fruits of all types.

WHEN TO TREAT: Apply TELONE II either in the spring or fall, whenever soil type and conditions permit. For best results with annual crops, treat the soil each year. In northern states, late summer, or early fall treatment (before October 15) is best for land to be planted to early spring crops, especially transplanted crops such as celery, tomatoes, and nursery and orchard stock. Early fall treatment permits planting a fall cover crop. Note: Treat muck soils only in the early fall and plant as late as possible in the spring; treat fine textured (clay) soils only when they are near or at the wilting point. Do not use TELONE II to treat any type of soil when it is cold and/or wet.

SOIL PREPARATIONS: TELONE II gives best results when conditions permit rapid diffusion of the fumigant through the soil and the soil surface can be sealed to prevent excessive furnigant loss during the exposure period. The soil should be in good seed bed condition, free of clods and undecomposed plant material. moisture at about one-half of field capacity, and temperature between 40° and 80°F at the depth of injection. If undecomposed plant debris is present, it should be plowed down and allowed to decompose before applying TELONE II. Tillage deeper than 12 inches is necessary for good fumigant penetration in soils where a hard or "plow" pan occurs at plow depth. Where deep tillage is used, the tillage equipment may often be modified to simultaneously apply the fumigant and thus avoid going over the field twice.

APPLICATION: TELONE II may be applied either as an overall (broadcast) or row treatment, using suitable application equipment that will ensure placement of the fumigant at least 6 to 8 inches below the final soil surface. For overall application use either plowsole or chisel equipment with the chisels spaced 12 inches apart. When the fumigant is injected at a depth of 12 inches or more (deep tillage), the chisel spacing may be up to twice the application depth but should not exceed 30 inches. Application may be made in the same direction or at an angle to the direction of the planting row, whichever is most convenient. For row application, use chisel equipment with one chisel per row or two chisels spaced 12 inches apart to treat only the soil where the crop is to be planted. When one chisel per row is used, adjust the fumigant flow rate to distribute about 11/3 times more fumigant per chisel than is recommended for overall application. When two chisels are used per row, apply at the same flow rate per chisel as for overall. In both cases, the amount of furnigant required per acre will decrease as the distance between rows is increased and vice versa. At time of planting, avoid placing the seed row directly over the furrow left by the applicator chisel. When a single chisel is used per row, place the seed 3 to 4 inches to one side of the chisel furrow; when two chisels are used, plant in the center of the area between the chisel furrows.

SEALING: Immediately after application, compact the soil surface to prevent excessive fumigant loss. After chisel application, use a roller, cultipacker, or similar sealing device. After plow-sole application, disk the land, then compact it by floating or rolling. Sealing after row application can be accomplished by the tractor wheel, by listing, or by bedding so that the fumigant will be 12 to 14 inches below the top of the bed. When fumigating listed rows, seal in the fumigant with ring rollers, press sealers, or by re-listing

EXPOSURE PERIOD: After application and sealing, leave the soil undisturbed for 7 to 14 days. A longer exposure period will be required if the soil becomes excessively cold or wet during the exposure period

AERATION AND PREPARATION OF SOIL BEFORE PLANTING: At the end of the exposure period allow the soil to aerate completely before planting the crop. Aeration is usually complete when the odor of TELONE II is no longer evident. Under optimum soil and weather conditions, allow one week of aeration time for each 10 gallons of TELONE II applied per acre. When TELONE II is used for treating deep-rooted tree and shrub planting sites, a 3 to 6 months aeration period should be allowed. To hasten aeration, especially if heavy rains or low temperatures occur during the exposure period, work the soil to the depth of the treatment zone. After row treatment use a knife-like chisel in the bed without turning the soil, thus reducing possible recontamination of the treated soil. To hasten aeration after overall treatment, plow or deep cultivate to the depth of the treatment zone. This is especially desirable in northern states after fall fumigation of muck soils

quackgrass and for suppression of the damaging effects of Verticillium wilt in fields to be planted to white potatoes Apply as an overall treatment according to the following directions

Time of Treatment	Gallons per Acre	Fl. Oz./1000 Ft. Row per Chisel
Spring	17 to 25	50 to 73
Fall	25 to 34	73 to 100

Mint in Northwestern States: Use 59 gallons of TELONE II per acre (173 fl. oz 1000 ft. row per chisel) as an overall treatment in the spring, or preferably in the fall, to aid in the reduction of the damaging effects of Verticilium wilt in disease infested land to be used for mint production. After treatment allow at least 7 to 8 weeks or until the odor of the fumigant has left the soil before planting. Consult State Agricultural Experiment Station or State Extension Service Specialists for the use of other practices such as flaming the stubble. weed control and cultural practices when using TELONE II as an aid to reducing damage caused by Verticillium witt

USE PRECAUTIONS

Important - Note Carefully. Fumigation may temporarily raise the level of ammonia nitrogen and soluble salts in the soil. This is most likely to occur when heavy rates of fertilizer and fumigant are applied to soils that

EXPOSURE PERIOD: After application and sealing, leave the soil undisturbed for 7 to 14 days. A longer exposure period will be required if the soil becomes excessively cold or wet during the exposure period

AERATION AND PREPARATION OF SOIL BEFORE PLANTING: At the end of the exposure period allow the soil to aerate completely before planting the crop. Aeration is usually complete when the odor of TELONE II is no longer evident. Under optimum soil and weather conditions, allow one week of aeration time for each 10 gallons of TELONE II applied per acre. When TELONE II is used for treating deep-rooted tree and shrub planting sites, a 3 to 6 months aeration period should be allowed. To hasten aeration, especially if heavy rains or low temperatures occur during the exposure period, work the soil to the depth of the treatment zone. After row treatment use a knife-like chisel in the bed without turning the soil, thus reducing possible recontamination of the treated soil. To husten aeration after overall treatment, plow or deep cultivate to the depth of the treatment zone. This is especially desirable in northern states after fall fumigation of muck soils

quackgrass and for suppression of the damaging effects of Verticillium wilt in fields to be planted to white potatoes. Apply as an overall treatment according to the following directions:

Time of Treatment	Gallons per Acre	Fl. Oz./1000 Ft. Row per Chisel
Spring	17 to 25	50 to 73
Fall	25 to 34	73 to 100

Mint in Northwestern States: Use 59 gallons of TELONE II per acre (173 fl. oz./1000 ft. row per chisel) as an overall treatment in the spring, or preferably in the fall, to aid in the reduction of the damaging effects of Verticillium wilt in disease infested land to be used for mint production. After treatment allow at least 7 to 8 weeks or until the odor of the fumigant has left the soil before planting. Consult State Agricultural Experiment Station or State Extension Service Specialists for the use of other practices such as flaming the stubble. weed control, and cultural practices when using TELONE II as an aid to reducing damage caused by Verticillium wilt

Important — Note Carefully. Fumigation may temporarily raise the level of ammonia nitrogen and soluble salts in the soil. This is most likely to occur when heavy rates of fertilizer and fumigant are applied to soils that are either cold, wet, acid, or high in organic matter. To avoid injury to plant roots, fertilize as indicated by soil tests made after fumigation. To avoid ammonia injury or nitrate starvation, or both, to crops on high organic soils do not use fertilizers containing nitrates until after the crop is well established and the soil temperature is above 65 F

Certain crops including cotton, sugarcane, and pineapple are tolerant to ammonia and the above rule does not apply to them. When using high rates of TELONE II as required by certain state nursery regulations. liming of highly acid soils before fumigation may stimulate nitrification and reduce the possibility of ammonia toxicity. Certain nursery crops such as citrus seedlings, Cornus sp., Crataegus sp., spruce, and vegetable crops such as cauliflower have shown evidence of phosphorus deficiency following fumigation To avoid this possible effect, it is suggested that additional phosphate fertilizer be used on soils where experience indicates a deficiency may occur

Attention: To avoid reinfestation of treated soil do not use irrigation water, transplants, tools, seed pieces, or crop remains that could carry soilborne pests from infested land. Clean equipment carefully before using

Since TELONE II soil fumigant is corrosive under certain conditions, flush all applicators with fuel oil or kerosche ammediately after use. DO NOT USE WATER. Do not use containers, pumps, or other transfer equipment made of aluminum, magnesium or their alloys, as under certain conditions TELONE II may be severely corrosive to such metals. Common protective clothing, such as rubber gloves and boots, etc., may be penetrated readily by this material. Polyethylene provides a good barrier. For field operations cover shoes and hands with polyethylene bags. Store TELONE II in tightly closed containers in a cool place away from dwellings. In outside storage, store drums on their sides to avoid accumulation of rain water in the top. or bottom recessed areas

Do not allow contamination of seeds plants, fertilizers or other pesticide chemicals. Do not contaminate food, feedstuffs, or domestic water supplies

To avoid injury to fish and other wildlife, do not spill or empty TELONE II into streams, ponds, or other

Rinse equipment and containers and dispose of wastes by burying in non-crop larids away from water supplies. Dispose of empty containers by punching holes in them and burying with wastes. Use this product only as specified on this label
