

WEED CONTROL ON DITCH BANKS

Mix 1 gallon PENTA CONCENTRATE in 10 gallons of diesel oil. Spray on weeds. PENTA CONCENTRATE is a powerful herbicide that kills weeds and other plants. It is also effective when applied to crops in certain conditions.

WOOD PRESERVING

Mix 1 part PENTA CONCENTRATE with 1 part light oil. For general use, estimate 150 to 200 sq. ft. per gallon for brush application — two applications by this method are recommended, for all wood intended for use in contact with the soil. Or, estimate 5 to 10 gallons per thousand board feet for soaking application, making sure that a minimum 3 minute dip is used for all wood intended for use in contact with the soil. Allow at least 1 hour between applications of PENTA CONCENTRATE. Do not paint or varnish treated wood surface until it is thoroughly dry. 24 to 48 hour drying time is usually required.

Exposed posts, poles, foundation timbers and other heavy wood members should be free from bark, dry and well seasoned and immersed in the diluted product for 12-48 hours. Before the treatment of existing wooden structures, for control of powder post beetles or wood decay, all unsound wood should be cut out and removed two inches beyond any visible infestation.

SOIL POISONING FOR TERMITE CONTROL

Apply to soil in areas where termites are known to be present. This product is highly effective against termites and other soil-dwelling insects. It is also effective against ants and other insects that may be present in the soil.
