F & B WARRANTY

We warrant that the product conforms to its chemical description and is suitable for the purpose stated on the label when used in accordance with the directions under normal conditions of use, but we make no warranty of merchantability or fitness for a particular purpose, express or implied, extends to the use of this product contrary to label instructions, or under abnormal conditions or under conditions not reasonably foreseeable to seller and buyer, and we assume the risk of any such use.

WHY AND HOW TO USE F & B DORMANT OIL

In the early spring when oils are applied, many plant pests such as scale, aphids, mites, and beetles are just becoming active. Oil sprays effectively kill plant pests at this time because the oil covers and suffocates them, and they provide an effective control with a minimum possibility of plant pests developing resistance.

Summer sprays are not as effective because when they are applied in the early spring the sprays are state dry. Many trees and shrubs can also be treated in spring with oil sprays to prevent them from getting through to the next year.

Good Coverage Important—To kill insects, the spray must cover the entire plant. Good coverage is essential. A good spray must be applied with the nozzle held close to the plant and the spray directed at the leaves. To do this, the application should be done on the tree, applying sufficient spray to the underside of the leaves. Do not use excessive pressure or high speed nozzles.

What Oils Control—F & B Dormant Oil sprays will control scale, mites, and other insects on evergreens, shade trees, ornamentals, and shrubs. It will also control scale, mites, and other insects on deciduous fruit trees and small fruit.
