DIRECTIONS FOR USE

It is a violation of Federal law to use this product in a manner inconsistent with its labeling.

REENTRY STATEMENT: Reentry into treated areas is prohibited until leaves are completely dry or until 24 hours after application. Do not enter treated areas without protective clothing. Because certain states may require more restrictive reentry intervals for various crops treated with this product, consult your State Department of Agriculture for further information.

Written or oral warnings must be given to workers who are expected to be in a treated area or in an area about to be treated with this product. When oral warnings are given, warnings shall be given in a language customarily understood by workers. Oral warnings must be given if there is reason to believe that written warnings cannot be understood by workers.

GENERAL INFORMATION: BAAM 50w is an insecticide for use on pears. When applied as directed, BAAM 50w will control pear psylla.

BAAM 50w can be applied by air or ground equipment, as dilute or concentrate sprays. The rate of BAAM 50w per acre is based on thorough coverage with a dilute spray of 400 gallons from a conventional sprayer. When using concentrate sprayers, the amount of water is reduced but the amount of BAAM 50w per acre should remain the same as when using dilute sprays.

COMPATIBILITY: BAAM 50w is compatible with most commonly used pear insecticides, miticides and fungicides, however, do not combine BAAM 50w with detergents, sulfur, Bordeaux mixture, NAA or other highly alkaline materials as a tank mix.

DO NOT GRAZE TREATED AREAS

PEAR PSYLLA: Apply 1 1/2 to 3 pounds BAAM 50w per acre. Where full dilute coverage requires less than 400 gallons per acre, use 6 to 12 ounces per 100 gallons.

For pre-bloom control of overwintering adults, apply BAAM 50w after eggs have moved into the female psylla oviduct, but prior to heavy egg laying. For best results, BAAM 50w should be applied when daily maximum temperatures exceed 50°F. Consult your local University Extension Service for further information concerning best timing for control of overwintering adult psylla.

If weather or orchard conditions do not permit spraying before heavy egg laying, spray after the majority of the first generation eggs have hatched.

For post-bloom control, apply BAAM 50w as needed. Best control will be obtained when the majority of pear psylla are in the adult or young nymphal stages of development.

Rate should not exceed 3 pounds of BAAM 50w per acre per application. Do not apply within 7 days of harvest. Do not apply more than 21 pounds per acre of BAAM 50w during the use season.
