DAIRY CATTLE SPRAY

Directions for Use

GENERAL INFORMATION

Pyrenone Dairy Cattle Spray is a special insecticide formulation compounded for the dairy industry. Pyrenone Dairy Cattle Spray is especially effective for rapid control of hornflies on dairy cattle and for the protection of cows from other biting flies, mosquitoes and gnats.

To protect dairy stock from hornflies, houseflies, stableflies, gnats, mosquitoes and certain other flying pests, spray once daily at milking time, after cattle enter the barn, using 1 to 2 ounces per head. The spray should be applied as a light mist primarily to envelop or hit the flies as they attempt to leave the cows. May be used twice daily at the rate of 1 ounce per animal. Do not use more than 2 ounces per day per animal. Avoid wetting the hides of the animals.

Cattle may be sprayed very lightly once a day instead of attempting to build up a residual repellency by spraying more heavily.

Use Pyrenone Dairy Cattle Spray as a space spray treatment in barns, houses and milk parlors for control of the control of flies. Direct mist toward the upper portions of the enclosure, filling the air with fine spray particles, using approximately 2 ounces of material for each 1,000 cubic feet of space. Whenever possible, keep doors and windows closed for 10 minutes after application.

CAUTION

Do not spray on wet hides. Avoid wetting the hides of animals. Do not spray on animals coming out from spray.

NOTICE

Offer warranty that the product is effective against hornflies, houseflies, stableflies, gnats, mosquitoes and certain other flying pests on dairy cattle. The warranty is void if the product is used in any manner other than as directed on the label. The warranty is void if the product is used on animals other than dairy cattle. The warranty is void if the product is used on animals other than dairy cattle. The warranty is void if the product is used on animals other than dairy cattle.
