

DOWFUME[★] W-4

A Fumigant For Controlling Wireworms and Root Knot Nematodes

DIRECTIONS: Dowfume W-40 is a soil fumigant that is to be applied without dilution to soil that has been plowed and prepared in a suitable condition for planting. For row application prior to planting tobacco, set the equipment to apply seven (7) gallons per acre in your conventional width rows. Apply at least 6 to 8 inches deep and cover immediately so as not to allow the gases to escape as this is a very volatile material. Allow ten days or two weeks interval before planting after treating. Extra care should be taken not to reinfest the soil after treating by throwing untreated soil from the middles on to the treated area or rows. Avoid transplanting or using plants that are already infested.

ACTIVE INGREDIENTS

Ethylene Dibromide

INERT INGREDIENTS

TOTAL
