

2006-3

DIRECTIONS

To protect dairy stock from horn flies, house flies, stable flies, gnats, mosquitoes, spray twice daily, just before milking time, using 1 to 2 ounces per head, applied as a light mist. After a week of such treatments, spraying may be reduced to once a day and then, if your experience justifies, reduce the spraying to once every other day, and by the 3rd or 4th week try one treatment every few days. A set rule does not always work, but it has been found that the above timing of treatment is usually sufficient to maintain adequate protection against horn flies and mosquitoes, both in the barn and in the pasture. NOTE: This insecticide may be used as an inhibitor of the development of blood-sucking and biting lice on cattle. Spray about 2.5 ounces on mature animal, then brush into the hair thoroughly so as to reach the hide, paying particular attention to infested areas. This treatment should be repeated only when necessary and not often, than once in three weeks. Use Good-Way Cattle Spray in barns, houses and milk houses for effective control of flies. Direct the mist toward the upper portion of the enclosure, filling the air with spray, and using approximately 2 ounces of material for each 1,000 cubic feet of space. Whenever possible, keep doors and windows closed for 15 minutes after application. The better control of the mist, the better the results. Keep milking utensils and milk covered when milking.

CAUTION: HARMFUL IF SWALLOWED

ONE GALLON

GOOD-WAY CATTLE SPRAY

FOR THE PROTECTION OF DAIRY ANIMALS FROM HORN FLIES, MOSQUITOES AND GNATS AND FOR CONTROL OF STABLE FLIES IN BARN AND MILK HOUSES.

REPEAT APPLICATION AS NECESSARY SHOULD BE MADE FOR PROTECTION OF THE ANIMAL AND FOR THE REDUCTION OF FLIES IN BARN AND MILK HOUSES.

Good-Way Cattle Spray is a special insecticide formulation compounded for the dairy industry. It contains piperonyl butoxide and pyrethrins. Good-Way Cattle Spray is especially effective for rapid and economical control of horn flies on dairy cattle and for their protection from stable flies, mosquitoes and gnats.
