

TERMITE CONTROL: Add 1 quart to 12 gallons water. Dig a trench along the outside of the foundation walls. In brick or hollow block or concrete foundations, dig a trench to, **but not below**, the footing. Then, as the trench is re-filled, treat the soil at a rate of 4 gallons per 10 linear feet **for each foot of depth**. A trench 3 feet deep would require 12 gallons per 10 linear feet. The objective is to establish a treated soil barrier which will prevent termite entry. Other critical areas may also require treatment. It is suggested that you consult the State Extension Service for advice.
