GALLONS

## DIRECTIONS FOR USE

Generally spray a gallon of Hopkins Vegetation Killer mixed at one gallon per water per 1000 sq. ft. of soil surface. Thoroughly wet soil surface to insure contact. Best results are obtained when applications are made during or after weed emergence while growth is succulent. Where vegetation is tall and dense, use 1 1/2 gallons of Hopkins Vegetation Killer in ten gallons of water per 1000 sq. ft. For control of hard to kill perennial weeds and grasses such as johnsongrass, bindweed, and wild carrot use 3-4 1/2 gallons per 1000 sq. ft. Although Hopkins Vegetation Killer has considerable activity through foliar contact, much of its activity is through the roots and, therefore, adequate rainfall to move the chemical into the root zone is necessary.

Under conditions where the rainfall is high and the growing season long, a second application may be necessary to maintain a weed free soil surface.

Care must be taken to keep this herbicide away from desirable flowers, trees and shrubs. Do not apply over roots of valuable trees or woody ornamental plants. Only apply herbicide outside the drip area of trees. Avoid spray drift to desirable plants.

Do not reuse empty container. Do not reuse, reclean, or destroy by perforation or crushing and burying in a safe place away from water supplies.
