FISHING COPPER RED

A semi-hard coating of excellent anti-fouling properties for the bottoms of all wooden craft.

FISHING COPPER PAINT is made with properties which allow for its application directly to bare wood. No special primers are required.

DIRECTIONS

Stir the paint well so that all the pigment is completely mixed with the liquid and keep it stirred.

FISHING COPPER PAINT will not settle hard in the can and, therefore, can be easily mixed right in the container.

When applying FISHING COPPER PAINT allow overnight drying between coats. It is recommended that, where circumstances permit, the last coat should be allowed at least two hours to harden before the vessel is launched. It is also suggested that the launching take place within five hours after final application. However, the launching may safely be delayed for several days if during this time care is taken that the composition is not subjected to the direct rays of the sun. It is unwise to leave copper and anti-fouling paints exposed to the air for long periods.

On paintings between tides, the quick drying of FISHING COPPER PAINT will be helpful.

Do not try to save on bottom compositions. The extent of efficiency is determined by the thickness of the coatings. Therefore, when possible, three full coats are recommended.
