

SUPPLEMENTAL LABELING

GENERAL

Apply the specified amount of BAYLETON 25% WP in 1 to 3 gallons of spray per 1000 sq. ft. PREVENTIVE RATE. To prevent infection, apply the preventive rate at 7 to 21 day intervals. When disease conditions are light to moderate use a longer interval, and when disease conditions are heavy use a shorter interval. Protective activity of BAYLETON can be greater than 21 days depending upon environmental conditions. Your observations should be made and BAYLETON 25% WP applied as needed for disease control. CURATIVE RATE. To control existing infections, apply the curative rate twice at 7 day interval then apply the preventive rate as needed to maintain control. Make all applications after mowing and allow foliage to dry thoroughly before mowing. Make a single application in fall or in spring before growth begins.

For first application in early spring, subsequent applications may be made at 30 day intervals depending on disease pressure. Control mildew and rust on foliage. Do not apply to wet foliage. Do not apply to plants under stress. Do not apply to plants with other diseases.
