WHEN TO APPLY

For a preventive program, begin applications before diseases appear and repeat treatments as needed, usually at intervals of 10 to 14 days, except during extended periods of cool, moist conditions when applications every 7 days may be advisable.

To control spread of disease, use as soon as disease is noticed. Repeat applications may be necessary, usually at intervals of 10 to 14 days. During cool moist conditions of extended periods, applications every 7 days may be advisable.

FOR CONTROL OF SNOW MOLD: Apply at rate of one 9 lb. bag to 3200 sq. ft. after the first killing frost in the fall. A second application should be made when the lawn is free of snow in mid winter, and this should be followed by a third application after the final melting of snow in late winter or early spring.
