DEARCIDE 722 is used to control algae, bacteria and fungi in recirculating commercial and industrial water cooling towers. Prior to its use, systems must be cleaned to remove algal growth, microbiological slime and other deposits. An initial slug addition of 4.0 to 10.0 fluid ounces of DEARCIDE 722 per 1000 gallons of water, to provide a concentration of 32 to 80 parts per million DEARCIDE 722 based on the total weight of water in the system is recommended. Repeat until control is achieved. Subsequent slug additions of 1.0 to 10.0 fluid ounces of DEARCIDE 722 per 1000 gallons of water (8 to 80 parts per million of DEARCIDE 722) should be employed every two to five days, or as needed. The frequency of addition depends upon the relative amount of bleedoff and severity of the microbiological problem. See Product Bulletin 52-722. Slug additions should be made in the sump of cooling towers.
