DIRECTIONS

Mix into feed, supplements or salt at a level which will furnish one fourth of a gram of phenothiazine per 100 lbs. of body weight or 2 grams per head per day for adult cattle. When mixed with salt, mineral supplements or mineral protein supplements providing salt, feed continuously as the sole source of salt.

After the first breeding season, apply the 54% premix to the feed of the adult female population of the herd in the spring and feed it through the summer. This will help prevent the breeding of the flies and will help control the population of the flies. Since horn flies overwinter in the pupal stage, cattle should be treated when the flies first appear. This kills the flies emerging from last year's pupae and will prevent them from laying eggs. The 54% premix will control the horn fly population for about two weeks.

Since horn flies migrate from farm to farm, it is essential that they are kept from becoming a problem on a basis to assist in the reduction of the adult fly population.

For best results, animals should be dewormed with a therapeutic dose twice a year in the spring and for removal of the specified parasites. Continuous low level treatment of animals fed with the specified management practices will control the specified parasites and will help prevent resistance.

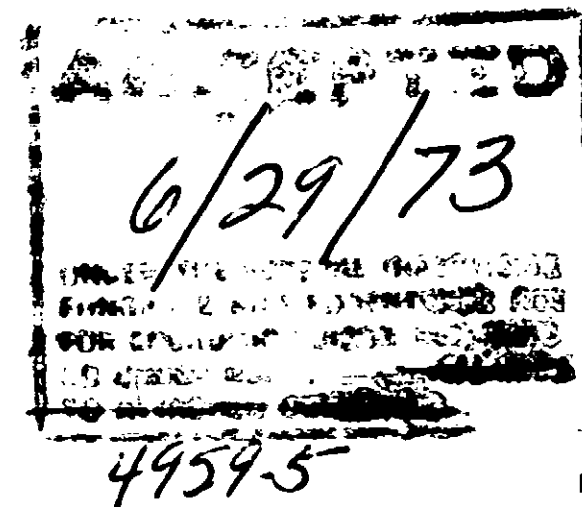

One pound of 54% premix will treat the following numbers of cattle for one day when mixed in the feed or supplement:

Number of Cattle

122
140
163
196
245
326

Average Body Weight

800 lbs. or larger
700 lbs.
600 lbs.
500 lbs.
400 lbs.
300 lbs.

WARNING

KEEP OUT OF REACH OF CHILDREN

Do not administer to lactating dairy animals. Occasional sensitivity to phenothiazine has been reported in cattle. Certain parasites may become resistant to phenothiazine therapy.

DO NOT REUSE CONTAINER. DESTROY IT BY BURYING WITH WASTE OR BURNING. STAY AWAY FROM SMOKE OR FUMES.
