When used as directed, this product is effective as a pool water disinfecting agent.

The filter system should be backwashed or properly cleaned and the pH adjusted between 7.4 and 7.6.

It is recommended that the pool be stabilized with 40-50 ppm trihydroxy triazine to nullify the dissipation effect of sunlight on chlorine. When using this product, both chlorine and trihydroxy triazine are being added to the water; however, it is necessary to initially stabilize pools with 40-50 ppm of trihydroxy triazine to effectively maintain the desired concentration of stabilizer.

Directions

Use 3 ounces of this product per 10,000 gallons of water as an initial treatment. Repeat until a residual of 1.0 to 2.0 ppm of available chlorine is established as determined by test kit. A test kit must be used regularly to determine when it is necessary to add another dose of this product to maintain the residual of 1.0 to 2.0 ppm of available chlorine in the pool water. An average is 2 to 3 ounces of this product per 10,000 gallons of water daily.
