Water Alkalinity and pH:

The total alkalinity and pH of the water is important and must be maintained within certain limits in order to obtain clear water; (1) rapid water kill; (2) algae control; (3) minimum skin and eye irritation; (4) minimum corrosion to metal parts of pool. The proper range is 7.2 - 7.6 for pH and 60 to 100 parts per million for total alkalinity. Test kits for determining each of the above are available from your dealer and are necessary for proper operation of any pool. After reaching the proper pH and total alkalinity, pH should be checked daily. Total alkalinity should be checked weekly. Adjust according to test results.

Storage and Handling:

- (1) Do not mix Pool ... cleaning compounds.
- (2) Store in cool place out of sight and sun.
- (3) Keep material in original container.
- (4) Keep container closed when not in use.
- (5) KEEP OUT OF REACH OF CHILDREN.
