

Methyl bromide is a colorless, odorless, non-flammable gas that is highly toxic to humans and animals. It is used as a fumigant for the control of insects and other pests in stored grain, foodstuffs, and other commodities. It is also used in the production of certain plastics and as a refrigerant in certain industrial processes. Methyl bromide is highly volatile and can be inhaled, absorbed through the skin, or ingested. It is also highly flammable and can form explosive mixtures with air. It is also highly corrosive and can cause severe damage to the respiratory system, eyes, and skin. It is also highly toxic to aquatic life and can cause significant damage to the environment. It is important to handle methyl bromide with extreme care and to use appropriate personal protective equipment (PPE) when working with it. It is also important to follow all safety instructions and to dispose of methyl bromide properly.

CONTAINER DISPOSAL

See label for disposal instructions.
