DIRECTIONS

CAUTION

Combustible Mixture F.D.N.Y.C. of A.

This product will kill mosquitoes, flies and many other annoying insects when used in electric foggers and electric sprayers which are so constructed they will produce a heavy smoke like fog. Small particles of insecticide produced by fogging remain suspended in the air longer than particles produced by a standard hand sprayer. The fogging method is more effective for insect control outdoors.

Do not attempt to fog your yard when a heavy breeze is blowing as the fog will be carried away before it has an opportunity to be effective against mosquitoes and other annoying insects. The ideal time for fogging is around dusk when the wind usually dies down and the temperature at ground level is somewhat lower than that of the air a few feet off the ground. Under such conditions the fog in the treated area will linger for a longer period of time.

The best effects will be dependent on weather conditions and if wet or if fog is produced. Wet fog contains larger particles of insecticide that have not been completely vaporized. Wet fog has a more lasting effect than dry fog, however, the residue left by the wet fog.

Be sure to use flowers, plants, shrubs, and vegetables. The effect of fog is dependent on the weather.

It is important to be sure to use the fogger in the correct position and direction. Do not use the fogger in the wind. We recommend that the fogger be held 10 feet or more from the area being treated.

USE ONLY THE FLY-KIL INSECT KILLER. Do not use other insecticides. Do not spray on flowers, plants, shrubs, and vegetables. Do not spray on lawns, patios, terraces, and picnic grounds. Do not spray on food or drink.

CAUTION
