

CHLORINE GRANULAR 56

- * Dissolves immediately by broadcasteing in pool.
- * Most effective germicide and algicide.
- * Will not cause cloudiness in water.
- * Will not add scale forming minerals in water.
- * Will maintain cool crystall clear.
- * Flame resistant.

The control of pH is greatly simplified using Chlorine Granular 56. In fact, you will require from $\frac{1}{2}$ to $\frac{1}{4}$ times the amount of acid usually applied. Chlorine Granular 56 provides a more stable form of chlorine for easier maintenance of an effective chlorine residual in pool water for disinfecting action. It requires less storage space & maintains constant strength regardless of storage time. It is economical to use in that, after pool is stabilized, you will need to apply Chlorine Granular 56, less often.

DIRECTIONS

When starting a new pool, super-chlorinate to satisfy chlorine demand and to establish a chlorine residual of 1.0 to 1.5 ppm chlorine. To accomplish this, add 2 oz. Chlorine Granular 56 per 1,000 gals pool water. The next morning add Conditioner & Stabilizer at the rate of 4 oz per 1,000 gals to stabilize the pool water. Chlorine Granular 56 should be added daily or as needed at the rate of $\frac{1}{4}$ oz per 1,000 gals of water to maintain a chlorine residual at all times of 1.0 to 1.5 ppm as determined by a suitable test kit. The pH should be maintained between 7.2 & 7.6. A shock treatment should be made every week during hot weather or after heavy rains. Less frequent shock treatments may be made during cool weather. For shock treatment, add 2 oz Chlorine Granular 56 per 1,000 gals of water. Swimmers should not be permitted in pool until the chlorine residual has reached the 1.0 to 1.5 ppm range. Slight flexibility must be maintained with heavy accumulations of dust and dirt caused by storms or super heavy bathing loads which require additional dosages to maintain 1.0 to 1.5 ppm chlorine.
