Directions:

## FOR USE IN AUTOMATIC **AEROSOL DISPENSER:**

One unit should be installed for each 6,000 cubic feet of space to be treated. The Dispenser activates the 100 mg. valve once every 15 minutes; after two hours of operation, enough insecticide is suspended in the air to kill a substantial proportion of the flies, mosquitos and gnats present. Usually the effectivenss of the insecticide will be noticeable within one hour after the dispenser is acvitated. If less than 24 hour control is required, the dispenser should be set to start one hour before control is desired and run one hour after control is no longer needed. Keep in mind that such factors as air flow rate, size of space treated, humidity and room temperature all affect insect activity and control. Therefore, one unit per 6,000 cubic feet should be

considered as an average need with adjustments made depending on specific conditions at place of usage. As with any method of insect control best results are achieved when sanitation and other positive insect-prevention practices are followed. This 12 oz. can of insecticide contains approximately 3,300 - 100 mg. doses sufficient to sustain operation for a total of 825 hours (34 days on around-the-clock basis) or 68 days on a 12 hour basis. When used on a 24 hour basis, it is suggested that the container be changed once a month (once every 2 months on a 12 hour basis).

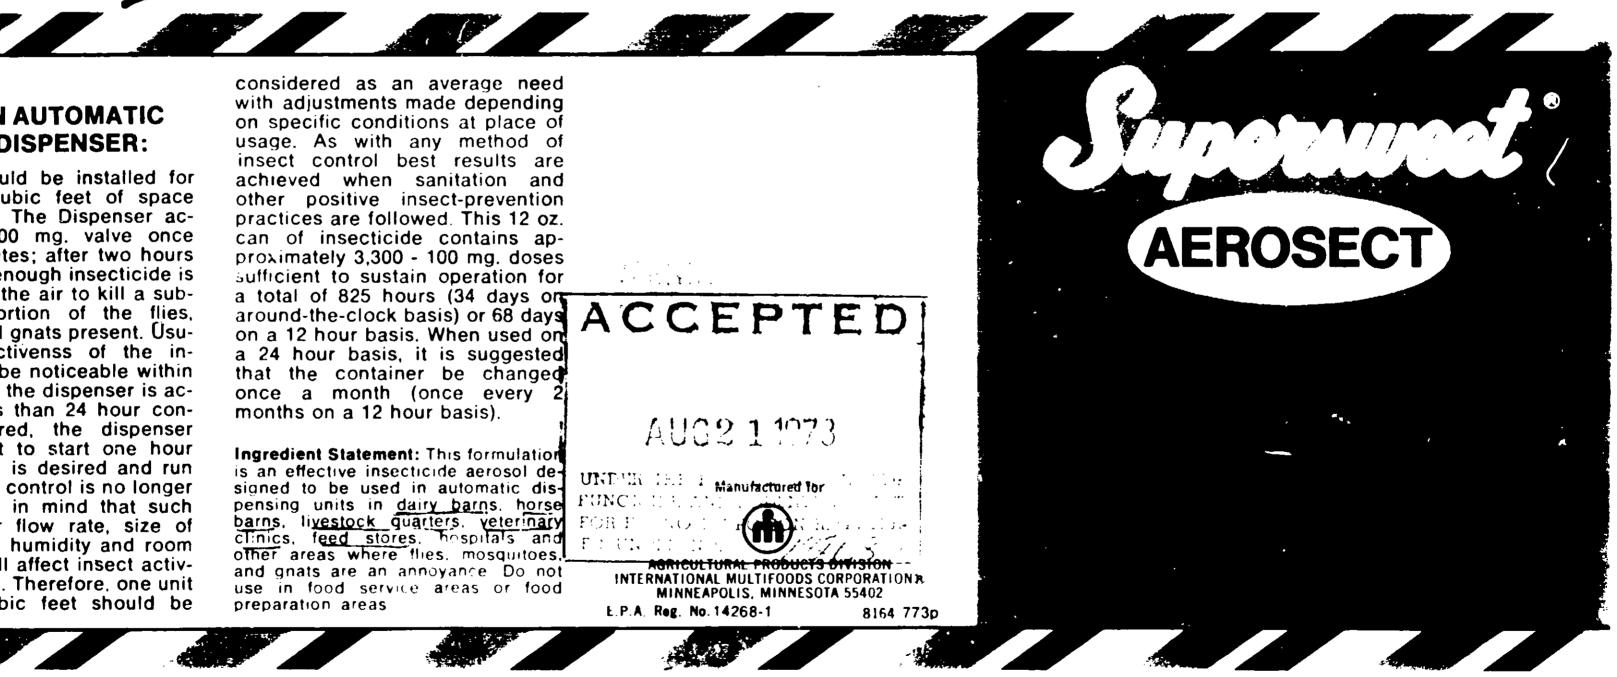

Ingredient Statement: This formulation is an effective insecticide aerosol designed to be used in automatic dispensing units in dairy barns, horse barns, livestock quarters, veterinary clinics, feed stores, hospitals and other areas where flies, mosquitoes, and gnats are an annoyance. Do not use in food service areas or food preparation areas
